

Description of the degree program

# Data Science (Master)

## PO 1

Date: 06.10.2023

## Table of contents

### Ramp Up Phase

Ramp up Course Mathematics.....	6
Ramp up Course Computer Science.....	8

### Methods and concepts of Computer Science

Pattern Recognition.....	11
Deep Learning Lab.....	13
Replication and Consistency.....	15
Knowledge based systems and deductive database systems.....	17
Warehousing and Data Mining Techniques.....	19
Information retrieval and web search engines.....	21
Introduction to Machine Learning.....	23
Visualization Techniques.....	25
Image Aspects.....	27
Python Lab.....	29
Advanced Software Engineering Lab.....	31
Software Quality 1.....	33
Software Architecture.....	35
Cloud Computing.....	37
Computational Geometry.....	39
Approximation Algorithms.....	41
Solving NP-hard Optimization Problems (lab).....	43
Machine Learning for Computer Security.....	45
Data Science Seminar.....	47
.....	50

### Methods and concepts of Mathematics

Statistical and machine learning.....	53
Risk and Extreme Value Theory.....	55
Optimization in machine learning and data analysis 1.....	57
Numerical Methods and Learning from Data.....	59
Numerical Linear Algebra in Data Science.....	61
Nonparametric Statistics.....	63
Nonnegativity and polynomial optimization.....	65
Statistical methods: Optimality and high dimensionality.....	67
Mathematical Seminar.....	69
Machine learning with neural networks.....	71
Continuous Optimization in Data Science.....	73
Inverse problems.....	75
Advanced Computerlab.....	77
Dynamic Optimization.....	80
Discrete Optimization.....	82
Computeralgebra.....	84
Algorithms and complexity for quantum computing.....	86
Model Order Reduction.....	88
Mathematical Foundations of Information Theory and Coding Theory.....	90
Mathematical Foundations of Data Science.....	92
Introduction to Quantum Information Theory.....	94

### Data Science in Applications - Engineering

Ecological Modelling.....	97
Fundamentals of Turbulence Modeling.....	99
Automotive Software Engineering.....	101
Basic Coastal Engineering.....	103
Introduction to Finite Element Methods.....	105

Railway Timetabling & Simulations.....	107
Deep Learning in Remote Sensing .....	109
.....	111
Basic Measurement Methods in Fluid Mechanics.....	113
Data-Driven Material Modeling.....	115
<b>Data Science in Applications - Image and Signal Processing</b>	
Mathematical Image Processing.....	118
Information Theory and Signal Processing.....	120
Deep Learning for imaging in nano and quantum science.....	122
Network Information Theory.....	124
Spoken Language Processing.....	126
Fundamentals of Digital Signal Processing.....	128
Digital Signal Processing.....	130
Computer Vision and Machine Learning.....	132
Biomedical Image and Signal Analysis.....	134
Deep Learning in Remote Sensing .....	136
.....	138
Computer Lab Pattern Recognition.....	140
<b>Data Science in Applications - Biology, Chemistry and Pharma</b>	
Immunometabolism.....	144
CM-B-3 Elucidation and Modelling of Biological Structures.....	146
CB-B-4 Theoretical Biophysical.....	148
Introduction to Chemometrics for Pharmaceutical Engineers.....	151
Network Biology.....	153
<b>Data Science in Applications - Medicine</b>	
Medical-methodological specialization module 1.....	156
Medical Methodology Course 2.....	158
Accident Informatics.....	160
Biomedical Image and Signal Analysis.....	162
Health-Enabling Technologies A.....	164
Health-Enabling Technologies B.....	166
Selected Topics of Representation and Analysis of Medical Data.....	168
<b>Data Science in Applications - Project Work</b>	
Project Work Data Science.....	171
<b>Key Qualifications and Ethics</b>	
Data Privacy & Data Governance.....	174
Key Qualifications.....	176
Scientific Presentation and Writing.....	178
.....	180
<b>Master's Thesis</b>	
Master's Thesis Data Science.....	183

ECTS	120

Ramp Up Phase	
ECTS	10

<b>Title</b>	Ramp up Course Mathematics		
<b>Number</b>	1294580	<b>Module version</b>	V2
<b>Shorttext</b>		<b>Language</b>	
<b>Frequency of offer</b>	every term	<b>Teaching unit</b>	Carl-Friedrich-Gauß-Fakultät
<b>Module duration</b>	1 Semester	<b>Institution</b>	
<b>Hours per Week / ECTS</b>	6 / 10,0	<b>Module owner</b>	
<b>Workload (h)</b>			
<b>Class attendance (h)</b>	72	<b>Self studying (h)</b>	228
<b>Compulsory requirements</b>			
<b>Recommended requirements</b>			
<b>Expected performance/ Type of examination</b>	1 ungraded examination (Prüfungsleistung): 1 written exam (120 minutes) according to examiner's specifications. After approval by the examination board mathematics (Prüfungsausschuss Mathematik), the examiner can also choose the take-home exam as the form of examination.  The exact examination specifications will be announced at the beginning of the course.		
<b>Course achievement</b>			
<b>Module grade composition</b>			
<b>Contents</b>			
<ul style="list-style-type: none"> <li>- Introduction to Data Science (2 weeks) - jointly with RampUp Computer Science</li> <li>- Algebra (2 weeks)</li> <li>- Numerics (2 weeks)</li> <li>- Discrete mathematics (2 weeks)</li> <li>- Analysis (2 weeks)</li> <li>- Stochastics (2 weeks)</li> <li>- Continuous optimization (2 weeks)</li> </ul>			
<b>Objective qualification</b>			
The students <ul style="list-style-type: none"> <li>- know understand the underlying concepts of mathematics that are necessary for data science</li> <li>- understand the concepts of analysis, algebra, optimization, discrete mathematics, stochastics and numerics and are able apply them in the context of data science</li> </ul>			
<b>Literature</b>

<b>Compulsory requirements</b>			
<b>Recommended requirements</b>			
<b>Expected performance/ Type of examination</b>	1 written exam, 90 minutes or oral exam, 30 minutes or Take-Home-Exam		
<b>Course achievement</b>	50% of exercises must be passed		
<b>Module grade composition</b>			
<b>Contents</b>			
<ul style="list-style-type: none"> <li>- Hardware consistency models and programming idioms.</li> <li>- Store atomicity, out-of-thin-air.</li> <li>- CAT.</li> <li>- C++11 atomics.</li> <li>- Concurrent data structures.</li> <li>- Pessimistic and optimistic concurrency.</li> <li>- Linearizability and observational equivalence.</li> <li>- Distributed systems and CAP.</li> <li>- Transactions and ACID.</li> <li>- Causal consistency, serializability, snapshot isolation.</li> <li>- Eventual consistency and CRDTs.</li> <li>- Conflict resolution.</li> </ul>			
<b>Objective qualification</b>			
After successful completion of this module, students will have a basic understanding of data replication strategies, consistency notions, and the corresponding programming methods. We cover all levels of abstraction, from hardware consistency models to geo-replicated databases. Confronted with an application, students will be able to develop and implement a suitable data replication scheme and argue for its correctness.

<b>Module grade composition</b>			
<b>Contents</b>			
<p>This module will give a broad overview over all methods and approaches that are necessary for reasoning over large knowledge bases using first order predicate logics. Moreover, the architecture of the Semantic Web is investigated with the a special focus on Semantic Web standards, modeling languages, ontologies and ontology languages, and advanced Semantic Web techniques. In particular,</p> <ul style="list-style-type: none"> <li>- Logic programming, predicate logic as a data model</li> <li>- Top-down and bottom-up strategies for query processing</li> <li>- Datalog and processing recursive Datalog queries</li> <li>- Query optimization with Magic Sets</li> <li>- Knowledge representation</li> <li>- Object-oriented extension, path queries</li> <li>- Recursion in databases, Common Table Expressions</li> <li>- User-Defined Types and User-Defined Functions</li> <li>- Semantic Web standards (RDF, OWL, etc.)</li> <li>- Semantic Web architecture and techniques</li> </ul>			
<b>Objective qualification</b>			
<p>On completion of this module, students are aware of the challenges and problems which arise from reasoning processes over large knowledge bases. This covers technical aspects (algorithms, implementations, etc.) and also methodological aspects (e.g. uncertainty, etc.). Furthermore, the students will be able to discuss the strengths and weaknesses of different approaches to reasoning and will be able to competently propose solution strategies to practical problem scenarios.</p>

<b>Contents</b>			
<p>This module will give a broad overview over all methods that are necessary for building and using data warehouses in large-scale applications. Besides typical techniques for warehouse design, indexing, and online analytical processing (OLAP), also advanced data mining techniques, such as classification, clustering, frequent item set mining, and association rules are covered in the lecture. In particular,</p> <ul style="list-style-type: none"> <li>- Statistical methods in databases</li> <li>- Knowledge discovery and mining of local structures</li> <li>- Frequent Item Set Mining and Association Rules</li> <li>- Hierarchical and partitioning clustering algorithms</li> <li>- (Linear) classification and support vector machines</li> <li>- Architecture of data warehouses (ROLAP, MOLAP,...)</li> <li>- Multi-dimensional data models (star, snowflake)</li> <li>- Extraction, data transformation and cleaning</li> <li>- Techniques for online analytical processing (OLAP)</li> <li>- Storage- and Index structures for data warehouses</li> </ul>			
<b>Objective qualification</b>			
<p>Data warehousing and mining the data within warehouses represent an important basis for corporate decision support. Students understand possible data warehouse architectures and their essential processes and know the details of the major data mining algorithms used, to be able to correctly and meaningfully underpin decisions with data. They are enabled to critically analyze and evaluate the respective application of various algorithms.</p>

<b>Contents</b>			
<p>The module gives an introduction to Web Information Retrieval with particular emphasis on the algorithms and technologies used in the modern search engines. It covers an introduction to traditional text IR, including Boolean retrieval, vector space model as well as tolerant retrieval. Afterwards, the technical basics of Web IR are discussed, starting with a Web size estimation and duplicate detection followed by link analysis and crawling. This leads on to the study of the modern search engine evaluation methods and various test collections. Finally, applications of classification and clustering in the IR domain are discussed. During the module the theoretical basis is illustrated by examples of modern search systems, such as Google, Bing, Yahoo!, etc. In particular,</p> <ul style="list-style-type: none"> <li>- Structured vs. unstructured data</li> <li>- Text retrieval, probabilistic, fuzzy- and vector space models</li> <li>- Assessment of retrieval quality, precision-recall analysis</li> <li>- Architecture of Web information systems and search engines</li> <li>- Structure of the WWW, Web crawling and indexing</li> <li>- Document clustering and ontologies for search</li> <li>- Text and link metrics, Page-Rank, HITS, etc.</li> </ul>			
<b>Objective qualification</b>			
<p>Information retrieval techniques play a central role not only in Web search engines, but in all kinds of document-centric applications. Students need to understand different techniques, their typical application areas and limitations, as well as their advantages and disadvantages. They are enabled to choose the right techniques for the respective practical problem and to critically reflect their use in the respective application context.</p>

<b>Objective qualification</b>			
This course offers an overview of computer graphics visualization. It conveys the psychological foundations of visual information perception and provides insight into their algorithmic implementation as basis for various visualization techniques. Graduates of this course will be familiar with relevant aspects of visual perception and cognition theory as well as algorithmic concepts of visualization.

<b>Objective qualification</b>			
This course offers insight into the formation, perception, and cognition of images. The natural phenomenon of images will be considered from the viewpoint of physics, information theory, neuroscience, and arts history. Graduates of this course will be familiar with relationships between optics, digital image processing, image statistics, visual perception, cognitive science and visual arts

<b>Objective qualification</b>			
<p>After successful completion of this module, students will have the competence to apply Python for designing and implementing small to medium software projects and analytic workflows with a focus on statistics and machine learning. During an interactive learning phase during which the students will be able to apply common packages such as scikit-learn, and they will be able to synthesize analysis workflows for diverse data science questions. These workflows will be presented and discussed in a mini-conference among the students. After the mini-conference, students will form small teams to develop data science software tools which will be presented during the closing event. They will gain the competence to critically evaluate machine learning workflows.</p>

<b>Contents</b>			
<p>1. Fundamental Basics (introduction, definition of terms, principles of software testing, general testing process, psychology of testing)</p> <p>2. Testing in the software life cycle (general V-model, component testing, integration testing, system testing, acceptance testing, testing new product versions, overview of test types)</p> <p>3. Static testing (structured group testing, static analysis, metrics)</p> <p>4. Dynamic testing (black box testing, white box testing, experience-based testing)</p> <p>5. Testmanagement (test organization and planning, economic aspects, testing strategies, test progress monitoring and control, failure management, requirements for the configuration management)</p> <p>6. Testing tools (types, selection, introduction)</p>			
<b>Objective qualification</b>			
<p>After completing this module, the students will know the fundamental basics of software testing. They can apply the testing process and master activities and techniques to support it. The students will be able to define test cases in all phases of the software life cycle. They know common testing procedures and methods to efficiently and effectively prepare and execute software tests. The students will know both the underlying theoretical management processes as well as the practical testing tools to automate software testing.</p>

<p>This lab aims at finding provably optimal solutions of NP-hard optimization problems, with the objective of practical methods for solving benchmark instances of interesting size. This is based on powerful mathematical methods (such as integer programming) and sophisticated solution software (such as CPLEX and Gurobi).</p>			
<b>Objective qualification</b>			
<p>Participants understand theory and practice of dealing with NP-hard problems. They can master exact solution methods, in particular based on integer linear programming. They have gained experience with implementing, testing and refining practical techniques and software, including the generation of benchmark instances, and visualization of results and performance.</p>

<b>Number</b>	4299990	<b>Module version</b>	
<b>Shorttext</b>	INF-STD-99	<b>Language</b>	englisch
<b>Frequency of offer</b>	every term	<b>Teaching unit</b>	Carl-Friedrich-Gauß-Fakultät
<b>Module duration</b>	1	<b>Institution</b>	
<b>Hours per Week / ECTS</b>	3 / 5,0	<b>Module owner</b>	
<b>Workload (h)</b>			
<b>Class attendance (h)</b>	42	<b>Self studying (h)</b>	108
<b>Compulsory requirements</b>			
<b>Recommended requirements</b>			
<b>Expected performance/ Type of examination</b>	1 Presentation		
<b>Course achievement</b>			
<b>Module grade composition</b>	The grade is determined by the active participation in the seminar and the quality of the presentation and the accompanying paper.		
<b>Contents</b>			
The course content has a mandatory relation to topics of data science. The concrete course content in the seminar depends on the subject area worked on and may vary each semester.			
<b>Objective qualification</b>			
<ul style="list-style-type: none"> <li>- The students are able to independently familiarize themselves with a scientific Topic.</li> <li>- They are able to prepare the topic and present it in an oral presentation.</li> <li>- The students are able to use adequate presentation technique and rhetorical skills.</li> </ul>

<b>Course achievement</b>	Non-graded coursework (Studienleistung): Homework according to examiner's specifications. The exact examination specifications will be announced at the beginning of the course.		
<b>Module grade composition</b>			
<b>Contents</b>			
The lecture contains models, criteria and methods for the analysis of vector data as graphs and to analyze networks, in particular, centrality and clustering, as well as optimization methods and fundamental analyses for different forms of machine learning. This may cover deep, artificial neural networks.			
<b>Objective qualification</b>			
The students - understand the of the complex links between their previous mathematical knowledge and the contents of the lecture - understand the theoretical body of the lecture as a whole and master the corresponding methods - are able to analyze and apply the methods of the lecture  - know and understand optimization methods for machine learning and machine learning in algorithms for optimization, in particular, discrete optimization and network optimization

<b>Contents</b>			
Students learn basic concepts and tools from numerical linear algebra that are used in data mining. After the course, students should be able to solve problems in data mining on their own using the methods discussed in the course.			
Ideas and algorithms from numerical linear algebra are important in several areas of data mining. This course gives an introduction on the information extraction from data by means of concepts and tools from numerical linear algebra. The following topics are covered in the course: low-rank-approximation of matrices, methods for least-squares-problems, the singular value decomposition, nonnegative matrix factorizations, eigenvalue algorithms.			
<b>Objective qualification</b>			
The students <ul style="list-style-type: none"> <li>- understand the of the complex links between their previous mathematical knowledge and the contents of the lecture</li> <li>- understand the theoretical body of the lecture as a whole and master the corresponding methods</li> <li>- are able to analyze and apply the methods of the lecture</li> </ul> <ul style="list-style-type: none"> <li>- know and understand the methods of linear algebra in the context of data mining</li> <li>- are able to analyze and evaluate problems in this field and to develop methods for their solution on the basis of the content of the lecture</li> </ul>

<b>Contents</b>			
<p>Advanced Computerlab Numerical Analysis</p> <p>The advanced numerics computing lab deals with advanced methods of scientific computing. We will discuss high-level application problems stemming from mathematics in finance, industry or data science. For numerically solving these problems, various numerical methods will be employed most of which have already been presented in courses such as „Numerische Methoden in der Finanzmathematik“, „Numerical Linear Algebra“, „Numerik gewöhnlicher Differenzialgleichungen“ or „Numerical Methods and Learning from Data“. These methods have to be implemented efficiently, if necessary, in parallel and they should be verified for practical examples. In doing so, the possibilities of these methods as well as their limits will be seen. For some demanding numerical subtasks well-established numerical software libraries exist which have proven to be very efficient in many cases. These can be migrated with the students' own implementations and one can waive the development of hand-written codes.</p> <p>Advanced Computerlab Optimization</p> <p>The goal is to combine advanced knowledge in mathematical optimization with practical planing and realization of large-scale optimization problems. To this end algorithms to solve complex mathematical models of mathematical optimization, partly known from the lectures "discrete optimization", „continuos optimization" or various advanced courses in mathematical optimization, shall be implemented and tested. Thereby, the possibilities and limits will be explored. A sufficiently wide sub-field of optimization may serve as general theme, e.g.</p> <ul style="list-style-type: none"> <li>- Algorithms for scheduling, knapsack, coloring or routing problems.</li> <li>- Algorithms for differentiable or non-smooth non-linear optimization problems with or without constraints.</li> </ul> <p>As well-tested and highly efficient methods are available for central methods, it is important to be able to use such software (e.g. CPLEX, Gurobi, Matlab) for pertaining applications.</p> <p>Advanced Computerlab Data Science</p> <p>In the Advanced Computerlab Data Science, current machine learning models are implemented, trained, applied and interpreted in order to work on practical questions on the basis of extensive structured or unstructured data sets. Fundamentals and techniques imparted on a theoretical level (e.g. models and their evaluation, optimization algorithms, interpretation techniques) are applied and expanded in practice by means of functions provided in various frameworks</p>			

(e.g. TensorFlow, Keras, Matplotlib). The independent implementation of machine learning models in Python forms a further focus in addition to the use of specialized frameworks.

**Advanced Computerlab Statistical Learning**

The focus of the Advanced Computerlab Statistical Learning is on well-known machine learning methods. These are mainly considered from the perspective of mathematical statistics. For presented structured and unstructured data, students are taught how to find suitable solutions, how to implement them, e.g. in the statistical software R, and how to interpret the results. Advantages and disadvantages of the methods used as well as the underlying model assumptions are discussed from a probabilistic or statistical point of view. Students have the opportunity to apply their knowledge of probability theory and mathematical statistics acquired in previous courses. One focus of the course is the independent implementation of machine learning models using frameworks such as TensorFlow, mlr3, Keras, among others.

**Objective qualification**

The students

- remember and understand the basic tasks and method of mathematical algorithms and their practical application
- are able to use mathematical programming tools
- are able to apply, analyze and implement mathematical algorithms
- are able to document and present mathematical algorithms

<b>Expected performance/ Type of examination</b>	Examination: Generation and documentation of computer programs		
<b>Course achievement</b>			
<b>Module grade composition</b>			
<b>Contents</b>			
[Distribution and population models(VÜ)] Approaches to and methods of ecological modelling Theoretical basics for the generation of ecological models (instructed in the exercises) Application examples of models in ecology and conservation biology Approaches to species distribution models in statistics and machine learning (parametric, semi-parametric and nonparametric techniques) Individual-based (agent-based) modelling Programming of species distribution models in R (or comparable software) Programming of individual-based population models with NetLogo (or comparable software)			
<b>Objective qualification</b>			
After successful completion of the module, students have knowledge of the key - statistical and machine learning - methods of species distribution modelling. They also have knowledge of the most important approaches to population dynamic modelling. The students are able to apply both modelling methods for dealing with geoeological and conservation biological questions and they know the advantages and disadvantages of these methods. They are capable to visualise and interpret data and models and to check underlying assumptions as well as to evaluate parameter sensitivities.

<b>Course achievement</b>	Presentation (20 min.)		
<b>Module grade composition</b>			
<b>Contents</b>			
<ul style="list-style-type: none"> <li>- Introduction to coastal engineering (sociological and ecological significance of the coastal zone, tasks and future of the coastal engineer)</li> <li>- Linear and nonlinear wave theories, including areas of validity and application</li> <li>- Wave transformation in shallow water (shoaling, refraction, breaking) and in interaction with obstacles (reflection, diffraction)</li> <li>- Formation mechanisms of the sea state, including procedures for its parameterization and prediction</li> <li>- Formation and prediction of tides in coastal areas and estuaries, including their special forms, significance and benefits</li> <li>- Formation and prediction of storm surges and design water levels</li> </ul> Insight into the current state of research in various fields of coastal engineering			
<b>Objective qualification</b>			
After successful completion of the module, students will have a broad and solid basic knowledge of the mechanics of water waves and hydrodynamic processes in the coastal area, which enables them to determine the load, erosion and transport parameters for the required constructive and functional planning of engineering measures. The students are able to use the linear and nonlinear theory of water waves to calculate the total wave induced current parameters and the associated effects on sediments, structures and other obstacles. By the mediated calculation basics for wave transformation the students can calculate the effects of the bottom in shallow water (shoaling, refraction, wave breaking) as well as of buildings and other obstacles (reflection, diffraction) on the parameters (height, length, direction) of the waves and their stability (refraction criterion) at the given planning location. On the basis of the acquired basics of the origin, parameterization, mathematical/statistical description and prediction of the sea state, the students are able to determine the design waves for the functional and constructive planning. They can determine the design water levels on the basis of the acquired knowledge on the formation and prediction of tides on open coasts and in estuaries as well as of storm surges on the German North Sea and Baltic Sea coasts. In the seminar, students are enabled to conduct scientific research and to present research results from current publications in an appropriate manner.

<b>Expected performance/ Type of examination</b>			
<b>Course achievement</b>			
<b>Module grade composition</b>			
<b>Contents</b>			
<p>In this module students are introduced to the concepts of deep learning in order to process Remote sensing data. Remote sensing is the science that provides geometric and semantic information about objects at or near the surface of the Earth using the sensors which are installed on satellites or other airborne platforms. Along with fundamentals of remote sensing, some applications like object detection and classification especially on images and also regression algorithms on remote sensing observations will be covered. In the context of image understanding, an introduction to digital image processing will be given, which deals with the application of filters on the images to extract the information which could be used in machine learning and deep learning algorithms. Each of the lectures in this module is supplemented by practical parts to enable the students to process real-world remote sensing datasets, efficiently. After completing the module, students know and understand the most important concepts of deep learning for image analysis. Furthermore, a student is able to implement a selection of algorithms and evaluate the respective result.</p>			
<b>Objective qualification</b>			
Upon completion of this module, the students will be able to understand basic principles and applications of deep learning and to apply them on Remote Sensing as well as similar problems.

<b>Module grade composition</b>			
<b>Contents</b>			
<p>This Module will introduce the fundamental methods at the core of machine learning, including -but not limited to- classification, regression analysis, clustering, and dimensionality reduction. This course is designed for BSc. and MSc. students in different disciplines who employ machine learning algorithms in their fields. Students will learn about the basic concepts of machine learning and will apply the learned concepts on the practical problems using open source libraries from the Python programming ecosystem. The course will also briefly cover neural networks and will be closed by a short introduction to deep learning. Classes on theoretical aspects will be complemented by practical lab sessions. In this course we do not concentrate on a specific type of data and various datasets will be used in the practical example.</p>			
<b>Objective qualification</b>			
<p>Upon completion of this module, the students will be able to understand basic principles and applications of machine learning and to apply them on practical examples.</p>			
<b>Literature</b>			
<ul style="list-style-type: none"> <li>• Hands-On Machine Learning with Scikit-Learn, Keras, and TensorFlow: Concepts, Tools, and Techniques to Build Intelligent Systems, Aurélien Géron, 2019.</li> <li>• Pattern Recognition and Machine Learning, Bishop, C. <b>Compulsory requirements</b>			
<b>Recommended requirements</b>			
<b>Expected performance/ Type of examination</b>	graded examination (Prüfungsleistung): 1 written exam (120 minutes) or 1 oral exam (25-35 minutes) according to examiner's specifications. After approval by the examination board mathematics (Prüfungsausschuss Mathematik), the examiner can also choose the take-home exam as the form of examination. The exact examination specifications will be announced at the beginning of the course.		
<b>Course achievement</b>	Non-graded coursework (Studienleistung): Homework according to examiner's specifications. The exact examination specifications will be announced at the beginning of the course.		
<b>Module grade composition</b>			
<b>Contents</b>			
- Interpolation and sampling, histograms - Linear and Morphological filters  A selection from the following topics: frequency methods, sampling theorem, applications of partial differential equations or variational methods.			
<b>Objective qualification</b>			
The students - understand the of the complex links between their previous mathematical knowledge and the contents of the lecture - understand the theoretical body of the lecture as a whole and master the corresponding methods - are able to analyze and apply the methods of the lecture  - know and understand the characterization of the quality of an image through mathematical quantities - know and understand the most important basic tasks in image processing and various methods of solving them

Using examples from ECG, X-ray imaging, magnetic resonance imaging and optical imaging systems we explain the general methods in medical signal and image processing. The methods are categorized according to their general properties, and the pros and cons of the manifold of methods is discussed using these categories. Systematic evaluation of signal and image analytics with and without ground truth is also addressed in this module.			
<b>Objective qualification</b>			
Passing this module, the students can classify and compare different methodologies for medical signal and image acquisition. They can differ and compare linear with non-linear filtering and analyze electrocardiography (ECG) data into their components. They can segment medical images in two and three dimensions and are able to apply model-based approaches for image and signal analytics.

<b>Course achievement</b>			
<b>Module grade composition</b>			
<b>Contents</b>			
<p>In this module students are introduced to the concepts of deep learning in order to process Remote sensing data. Remote sensing is the science that provides geometric and semantic information about objects at or near the surface of the Earth using the sensors which are installed on satellites or other airborne platforms. Along with fundamentals of remote sensing, some applications like object detection and classification especially on images and also regression algorithms on remote sensing observations will be covered. In the context of image understanding, an introduction to digital image processing will be given, which deals with the application of filters on the images to extract the information which could be used in machine learning and deep learning algorithms. Each of the lectures in this module is supplemented by practical parts to enable the students to process real-world remote sensing datasets, efficiently. After completing the module, students know and understand the most important concepts of deep learning for image analysis. Furthermore, a student is able to implement a selection of algorithms and evaluate the respective result.</p>			
<b>Objective qualification</b>			
Upon completion of this module, the students will be able to understand basic principles and applications of deep learning and to apply them on Remote Sensing as well as similar problems.

<p>This Module will introduce the fundamental methods at the core of machine learning, including -but not limited to- classification, regression analysis, clustering, and dimensionality reduction. This course is designed for BSc. and MSc. students in different disciplines who employ machine learning algorithms in their fields. Students will learn about the basic concepts of machine learning and will apply the learned concepts on the practical problems using open source libraries from the Python programming ecosystem. The course will also briefly cover neural networks and will be closed by a short introduction to deep learning. Classes on theoretical aspects will be complemented by practical lab sessions. In this course we do not concentrate on a specific type of data and various datasets will be used in the practical example.</p>			
<b>Objective qualification</b>

<b>Contents</b>			
<p>The course consists of hands-on programming tasks that are solved by the participants and subsequently evaluated in a semi-automated way. In total, seven units from the sub-fields (i) basics of hands-on application of machine learning methods, (ii) image processing (computer vision) and (iii) time series analysis have to be completed. The seven units are:</p> <ul style="list-style-type: none"> <li>• Interactive introduction to Python fundamentals using Jupyter notebooks, fundamentals of data processing, preparation and visualization.</li> <li>• Use of single-layer machine learning models to solve a two-class problem: Support vector machines (based on libsvm) and neural networks. Splitting and use of datasets, application of appropriate metrics for evaluation, use of high-level machine learning libraries such as SciKit-Learn</li> <li>• Use of deep neural networks to solve a multi-class classification problem, introduction to recognized academic datasets such as MNIST and CIFAR-10, introduction to the use of deep learning libraries PyTorch and Tensorflow, usage and adaptation of pre-trained models</li> <li>• Use of convolutional neural networks to solve more challenging image processing problems such as semantic segmentation and depth estimation, use of regularization methods in training</li> <li>• Use of diverse cost functions to optimize neural networks, implementation of generative models such as Generative Adversarial Networks (GANs)</li> <li>• Use of recurrent neural networks to solve problems based on time series data, application of concepts for anomaly detection</li> <li>• Use of recurrent neural networks for speech processing, e.g., for noise reduction, analysis of neural networks with respect to their complexity (FLOPs, number of parameters)</li> </ul> <p>Six out of the seven units have to be successfully passed for the entire computer lab module to be passed, among these unit 4 (convolutional neural networks) and unit 7 (recurrent neural networks in speech processing).</p>			
<b>Objective qualification</b>			
<p>In this course, students acquire the competencies to independently select and apply appropriate machine learning and deep learning methods for complex problems. The students ...</p>			

- ... master the programming language Python as well as the basics of the deep learning libraries PyTorch and Tensorflow.
- ... evaluate the effectiveness of simple machine learning models and neuronal networks for classification and regression problems.
- ... evaluate the quality of deep learning models on appropriate data (sub)sets with meaningful metrics
- ... know and use different types of neural networks for problems in the areas of image processing, time series processing and generative problems
- ... know and use different strategies for data preprocessing and data augmentation
- ... know and use different training and regularization methods for the optimization of neural networks
- ... evaluate the complexity of a neural network on the basis of various parameters

<b>Objective qualification</b>			
Passing this module, the students develop a fundamental understanding for methodological aspects of medical informatics. They can plan and conduct scientific studies and can develop novel research projects in the field of electronic health. The students can use, compare, and evaluate specific IT tools in medical informatics. They know about data privacy and security issues for medical data in Europe.

<b>Contents</b>			
The courses in this module vary from semester to semester. They are announced timely on the web page of PLRI.			
<b>Objective qualification</b>			
Passing this module, the students have earned a fundamental understanding of the methodological aspects of medical informatics. They can plan and conduct clinical trials and apply appropriate statistics to evaluate the recorded data. They can assess the systematics of scientific research in the broad biomedical field of applied computer science. They can compare IT tools for medical statistics and significance tests.

<b>Objective qualification</b>			
Passing this module, the students can define the goals and perform a technical analysis of traffic accidents. The understand accident and emergency informatics on a more general level, and know the components of this novel field of research. They can use IT systems for accident research and build systems using appropriate data formats, standards, and protocols. Furthermore, they can construct scientific experiments in the field of accident and emergency informatics.

<b>Contents</b>			
Using examples from ECG, X-ray imaging, magnetic resonance imaging and optical imaging systems we explain the general methods in medical signal and image processing. The methods are categorized according to their general properties, and the pros and cons of the manifold of methods is discussed using these categories. Systematic evaluation of signal and image analytics with and without ground truth is also addressed in this module.			
<b>Objective qualification</b>			
Passing this module, the students can classify and compare different methodologies for medical signal and image acquisition. They can differ and compare linear with non-linear filtering and analyze electrocardiography (ECG) data into their components. They can segment medical images in two and three dimensions and are able to apply model-based approaches for image and signal analytics.

Plan and conduct appropriate experiments including the data analytics using different sensors for unobtrusive assessment of health-determining parameters.			
<b>Objective qualification</b>			
Passing this module, the students can explain and compare health enabling technologies (HET). This includes knowledge and practical use of HET applications, and its underlying scientific foundation. The students are able to build HET systems using recent technologies and can plan, conduct, and analyze experiments to evaluate HET technologies.

<b>Contents</b>			
There is a rapid change in methodology and assessment of current techniques for medical data analytics, in particular using deep learning. Therefore, the content of this module reflects the actual technologies and will be announced shortly before the module starts.			
<b>Objective qualification</b>			
The students can recall recent trends and technologies to represent and analyze medical data. They are able to compare approaches and report their key characteristics resp. differences. They can construct tools and scientific methodologies for data modelling and analytics. The students recognize quality criteria and can recommend specific approaches.

<b>Compulsory requirements</b>			
<b>Recommended requirements</b>			
<b>Expected performance/ Type of examination</b>	Software/program development and report on a data science project. Successful participation will be confirmed and graded by the supervisor. Graded project thesis (3 months processing time).		
<b>Course achievement</b>			
<b>Module grade composition</b>			
<b>Contents</b>			
The teaching contents depend on the specific task and are partly taken from the project environment of the lecturer offering the course. They may vary on an annual basis.			
<b>Objective qualification</b>			
The project thesis can serve as preparation for the master's thesis. The students are able to use scientific methods systematically to solve a complex task in the area of data science. They are able to plan the work independently and estimate the work time required. They are able to carry out the project controlling and quality assurance e.g. using milestones which they have set for themselves.

<b>Course achievement</b>			
<b>Module grade composition</b>			
<b>Contents</b>			
<p>Target is to develop a sensitivity when dealing with data especially if it is person related data. Henceforth the lecture progresses to Data Governance beyond personal data ownership. The students will learn how an organisation can control the use of data by internal regulations and provisions and how intra-organisational data exchange is shaped by standards. The students should develop a broad understanding of the importance of standards and interoperability. Furthermore the students will learn what it takes and what to consider before such a provision/standard is established whether inside an organisation or on intra-organisational level.</p>			
<b>Objective qualification</b>			
<p>The students understand the differences between the two main legal systems (case law vs. common law) in the EU. They know different sources of legal knowledge. The students are able to assess company privacy regulations and business models in relation to the legal provisions.</p>

<b>Module duration</b>	1 Semester	<b>Institution</b>	
<b>Hours per Week / ECTS</b>	3 / 5,0	<b>Module owner</b>	Tim Kacprowski
<b>Workload (h)</b>			
<b>Class attendance (h)</b>	42	<b>Self studying (h)</b>	108
<b>Compulsory requirements</b>			
<b>Recommended requirements</b>			
<b>Expected performance/ Type of examination</b>			
<b>Course achievement</b>	1 Presentation and elaboration (short article) on a research topic		
<b>Module grade composition</b>			
<b>Contents</b>			
<p>In the first part of the course, topics include structuring the text, appropriate wording, comprehensibility of text, efficient production, review process and ethical aspects.</p> <p>The second part addresses the creation of "good" visualizations. Students will learn about fundamentals of perception, a proper mapping of data to visual variables, design principles, and visualization techniques and tools for specific types of data.</p> <p>The third part covers oral presentations and scientific talks. Using their own research projects as well as other topics in exercises, students will practice and improve the delivery of their oral presentations.</p>			
<b>Objective qualification</b>			
<p>Students will learn the principles of scientific oral and written presentation and how to improve their talking according to the audience and their writing for successful publishing. They will be enabled to properly criticize existing visualizations and create new visualizations that are effective, efficient, and appropriate.</p> <p>They will also learn how to properly structure a talk, how to prepare adequate visual aids ("presentations"), and how oral presentations are different from written text.</p>			
<b>Literature</b>			
<p>1. Manual for Writers of Research Papers, Theses, and Dissertations: Chicago Style for Students and Researchers (Chicago Guides to Writing, Editing, and Publishing)</p> <p>1. Englisch Ausgabe   von Wayne C. Booth, Gregory G. Colomb, et al.   16. April 2018</p> <p>2. BUGS in Writing, Revised Edition: A Guide to Debugging Your Prose Taschenbuch – 9. Februar 1998, Englisch Ausgabe von Lyn Dupre (Autor)</p> <p>3. The Elements of Style. Englisch Ausgabe   von Jr. Strunk, William, E. White, et al.   24. August 1999 4,6 von 5 Sternen 8.081</p>

<b>Recommended requirements</b>			
<b>Expected performance/ Type of examination</b>	Written thesis (final thesis) The presentation can be included in the evaluation with up to 3 of 30 credit points according to § 5 paragraph 7 (BPO)		
<b>Course achievement</b>			
<b>Module grade composition</b>			
<b>Contents</b>			
The contents depend on the specific assignment.			
<b>Objective qualification</b>			
The students are able to work on a problem in the field of data science independently using scientific methods within a given time period.			
The following points are particularly important:			
<ul style="list-style-type: none"> <li>- The student can familiarize themselves with the topic of the work independently.</li> <li>- They can systematically work on a research problem relevant to data science using scientific methods.</li> <li>- They are able to present the methods and the results in the form of an report.</li> <li>- They present the main results in an understandable form in a presentation.</li> <li>- They able to research literature and put their work into context.</li> </ul>
