

Description of the degree program

# Electrical Engineering and Information Technology (Master) PO 5

Date: 05.10.2026

## Table of contents

### Master Electrical Engineering and Information Technology

#### Compulsory Module

|                                             |    |
|---------------------------------------------|----|
| Ambits of Electromagnetic Field Theory..... | 8  |
| Advanced Applications of Field Theory.....  | 10 |

#### Major Specialisation: Information Technologies - Compulsory Elective Modules

|                                                               |    |
|---------------------------------------------------------------|----|
| Coding Theory.....                                            | 12 |
| Electromagnetic Theory for Microwave Engineering.....         | 14 |
| Information Theory.....                                       | 16 |
| New Architecture and Protocols in Communication Networks..... | 18 |
| Optimization and AI for Communication Networks.....           | 20 |

#### Major Specialisation: Information Technologies - Elective Modules

|                                                                   |     |
|-------------------------------------------------------------------|-----|
| Quality Assurance and Optimization.....                           | 22  |
| Automated Road Vehicles: from Assistance to Autonomy.....         | 24  |
| Integrated Circuits.....                                          | 26  |
| Packaging and Interconnection Technology.....                     | 28  |
| Semiconductor Technology.....                                     | 30  |
| Optical Communications with Lab.....                              | 32  |
| Optoelectronics.....                                              | 34  |
| Microwave Circuit Design 2 (Nonlinear Circuits).....              | 36  |
| Antennas and Electromagnetic Radiation.....                       | 38  |
| Linear Microwave Circuit Design (including Laboratory Class)..... | 40  |
| Radar Systems and Signal Processing.....                          | 42  |
| Nonlinear Photonics.....                                          | 44  |
| Electromagnetic Theory for Microwave Engineering.....             | 46  |
| Linear photonics with practical course.....                       | 48  |
| Communication Networks for Engineers.....                         | 50  |
| Network Security.....                                             | 52  |
| Performance Evaluation of Communications Network.....             | 54  |
| Advanced Topics in Security.....                                  | 56  |
| Information Technologies for Social Good.....                     | 58  |
| New Architecture and Protocols in Communication Networks.....     | 60  |
| Network-Security.....                                             | 62  |
| Advanced Topics in Network Engineering.....                       | 64  |
| Numerical Calculation of Radiation Properties.....                | 66  |
| Electromagnetic Compatibility.....                                | 68  |
| Electromagnetic Compatibility with Seminar.....                   | 70  |
| Analog Integrated Circuits with Lab.....                          | 72  |
| Analog Integrated Circuits.....                                   | 74  |
| Integrated Circuits for Biomedical Applications.....              | 76  |
| Modelling and Simulation of Mobile Radio Systems.....             | 78  |
| Planning of Terrestrial Radio Networks.....                       | 80  |
| Fundamentals of Mobile Radio Communications.....                  | 82  |
| Speech Communication.....                                         | 84  |
| Microwave and Wireless Metrology.....                             | 86  |
| Advanced Seminar "Machine Learning".....                          | 88  |
| Network Information Theory.....                                   | 90  |
| Spoken Language Processing.....                                   | 92  |
| Pattern Recognition.....                                          | 94  |
| Physical Layer Security.....                                      | 96  |
| Information Theory.....                                           | 98  |
| Physical Layer Security 2.....                                    | 100 |
| Multimedia Networking.....                                        | 102 |
| Computer Networks 2 (MPO 2017).....                               | 103 |

|                                                                                                             |     |
|-------------------------------------------------------------------------------------------------------------|-----|
| Mobile Communications.....                                                                                  | 105 |
| Operating Systems.....                                                                                      | 106 |
| Low power CMOS data converter circuit design.....                                                           | 108 |
| Computer Architecture 1.....                                                                                | 110 |
| Media Technologies.....                                                                                     | 112 |
| Applied Quantum Computing: Basics and Devices.....                                                          | 114 |
| Quantum Communication Networks.....                                                                         | 116 |
| VLSI-Lab.....                                                                                               | 118 |
| .....                                                                                                       | 120 |
| Post Shannon Theory.....                                                                                    | 122 |
| Hardware Software Codesign.....                                                                             | 124 |
| Micro- and Precision Assembly.....                                                                          | 126 |
| Advanced Topics in Network Engineering.....                                                                 | 128 |
| Emerging Memory Technologies.....                                                                           | 130 |
| Neuromorphic Computing & Engineering.....                                                                   | 132 |
| Phase-Locked Loops and Frequency Synthesis.....                                                             | 134 |
| Verification, Validation and Testing of ASIC Designs.....                                                   | 136 |
| Memory Systems.....                                                                                         | 138 |
| Advanced FPGA-Design.....                                                                                   | 140 |
| <b>Major Specialisation: Energy Systems and Drive Technologies/Powertrain - Compulsory Elective Modules</b> |     |
| Control of Electrical Devices.....                                                                          | 142 |
| Applied Power Electronics.....                                                                              | 144 |
| A.C. Drive Systems and their Computer Simulation.....                                                       | 146 |
| Electric Power Systems Engineering.....                                                                     | 148 |
| Electrical Systems and Grids.....                                                                           | 150 |
| Introduction to power grid technology.....                                                                  | 152 |
| <b>Major Specialisation: Energy Systems and Drive Technologies/Powertrain - Elective Modules</b>            |     |
| Advanced Control Engineering.....                                                                           | 154 |
| Control of Electric Power Systems.....                                                                      | 156 |
| Control of Electrical Devices.....                                                                          | 158 |
| Electrical Machines and Drives.....                                                                         | 160 |
| Basic Circuits of Power Electronics.....                                                                    | 162 |
| Design of Electrical Machines.....                                                                          | 164 |
| Drives for Electric Road Vehicles.....                                                                      | 166 |
| Applied Power Electronics.....                                                                              | 168 |
| A.C. Drive Systems and their Computer Simulation.....                                                       | 170 |
| Advanced Power Electronics.....                                                                             | 172 |
| Electromagnetic Compatibility.....                                                                          | 174 |
| Electromagnetic Compatibility with Seminar.....                                                             | 176 |
| High Voltage Engineering 1.....                                                                             | 178 |
| System Technology for Photovoltaic.....                                                                     | 180 |
| Electrical Railways.....                                                                                    | 182 |
| Energy Economy and Market Integration of Renewables.....                                                    | 184 |
| High Voltage Direct Current Transmission Technology.....                                                    | 186 |
| Design and calculation of DC systems.....                                                                   | 188 |
| Design and Function of Energy Storage Systems.....                                                          | 190 |
| Electric Power Systems Engineering.....                                                                     | 192 |
| Electrical Systems and Grids.....                                                                           | 194 |
| Numerical Methods.....                                                                                      | 196 |
| Innovative Energy Systems.....                                                                              | 197 |
| Electrical Transmission Systems Technology.....                                                             | 199 |
| electrotechnical laboratory practical course specialization battery technologies.....                       | 201 |
| Electrical Distribution Systems Technology.....                                                             | 203 |

|                                                                                                 |     |
|-------------------------------------------------------------------------------------------------|-----|
| Introduction to power grid technology.....                                                      | 205 |
| High-Voltage Test- and Measurement Systems.....                                                 | 207 |
| <b>Major Specialisation: Photonics and Quantum Technologies - Compulsory Elective Modules</b>   |     |
| Nano- and Bioelectronic System.....                                                             | 209 |
| Optoelectronics.....                                                                            | 211 |
| Nonlinear Photonics.....                                                                        | 213 |
| Analog Integrated Circuits.....                                                                 | 215 |
| Gallium Nitride Technology.....                                                                 | 217 |
| <b>Major Specialisation: Photonics and Quantum Technologies - Elective Modules</b>              |     |
| Fundamentals of Nano Optics.....                                                                | 219 |
| Nanoelectronics.....                                                                            | 221 |
| Integrated Circuits.....                                                                        | 223 |
| Solar Cells.....                                                                                | 225 |
| Semiconductor Metrology.....                                                                    | 227 |
| Packaging and Interconnection Technology.....                                                   | 229 |
| Special Problems in Semiconductor Nano Technology.....                                          | 231 |
| Semiconductor Technology.....                                                                   | 232 |
| Nano- and Bioelectronic System.....                                                             | 234 |

| The students can explain the structure of the Maxwell equations in differential form, herefrom derive the fully dynamic field solution of the Hertzian dipole and, depending on the special case, give reasons for idealized approximate solutions. By this they can analyze fundamental electrotechnical configurations and abstract to the essential details. They can choose and apply appropriate solution methods for example for energetic problems, Poynting theorem and temporal and spatial variable fields. They can integrate electromagnetic interactions into the Schrödinger equation of quantum mechanics and solve elementary problems in this context. They are familiar with applications of field theory in the field of antenna design. |                                              |                   |                                                               |

| Upon completion of the module, students will be able to explain the structure of Maxwell's equations in differential form, derive the fully dynamic field solution of Hertz's dipole from this, and justify idealized approximate solutions depending on the application. This will enable them to analyze basic electrical engineering arrangements using field theory methods and abstract the essential details. They can select and apply suitable solution methods, for example, for energy problems, Poynting's theorem, and fields that vary in time and space. They can integrate electromagnetic interactions into the Schrödinger equation of quantum mechanics and solve elementary problems in this context. They are familiar with applications of field theory in the field of antenna design. |                                              |                   |                                                          |

| Students can either choose this module or the module "Ambits of Electromagetic Field Theory". It is not possible to attend both.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                              |                   |                                                          |

| Upon completion of the module, students will have an understanding of the information-theoretical limits of data transmission and will have acquired knowledge of source and channel coding methods in theory and application. Students will be able to assess the performance of source and channel coding methods and construct simple codes. |                                              |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                            |                   |                                                          |
| <div>After completing the module, students will have in-depth knowledge and a well-founded conceptual understanding of the theory of electromagnetic waves with respect to the solution of the homogeneous wave equation (waveguide structures) as well as of the inhomogeneous wave equation (antennas). They have become familiar with different analytical and numerical solution methods for electromagnetic problems and exemplarily implemented selected methods as well as applied them in the context of commercial 3D-EM software. They will be able to select problem-adapted solution methods and to apply them competently to electromagnetic problems.</div> <div>According to the didactic concept of the course and the design of its individual parts, interdisciplinary qualifications are conveyed and practiced. In the context of assignments, colloquia and presentations these are scientific writing and documentation, scientific discussions and presentation techniques as well as teamwork in the laboratory or within team project assignments.</div> |                                                                                                                            |                   |                                                          |

| The lecture provides an introduction to the fundamentals of Shannon information theory. The goal is that students can derive the main information theoretic results on maximal achievable lossless (source coding) and lossy (rate distortion theory) compression of data and on maximum data rates for reliable data transmission (channel coding). The methods and tools required, e.g., information measures (entropy, mutual information, capacity etc.) and their properties (typical sequences) will be covered as well as practical applicable simple codes (block, turbo and polar codes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                             |                   |                                                          |

| After completing this module, students will have in-depth knowledge of architectures and signaling protocols of new architecture and protocols in advanced communication networks, including the access networks, core and backone networks, optical transport networks, wireless networks and virtual private networks, such as data center networks and campus networks. The fundamentals learned enable students to design, analyze and evaluate new protocols, services and network architectures. |                                                          |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                |                   |                                                          |
| <p>Artificial intelligence and machine learning have entered all areas of modern engineering. In this module, students will learn the fundamental mechanisms and concepts behind AI and machine learning in the context of communication engineering and apply them to current developments in 6G and WiFi.</p> <p>Students will:</p> <ul style="list-style-type: none"><li>• be familiar with the mathematical foundations of numerical optimization</li><li>• understand deterministic and stochastic gradient descent algorithms, which are used in nearly all ML algorithms</li><li>• be able to formulate regression problems and solve them using Python programs</li><li>• be able to formulate classification problems and solve them using supervised and unsupervised learning algorithms in Python</li><li>• apply advanced ML and LLM methods to optimize the physical layer in modern communication systems</li><li>• independently carry out small projects on the optimization of network parameters.</li></ul> |                                                |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                             |                   |                                                                        |
| After completing the module, students will have an overview of the fundamentals of quality management and process optimisation. Thanks to the practical knowledge acquired, students will be able to solve simple optimisation tasks using statistical design of experiments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                             |                   |                                                                        |

| After completing this module, students will have basic knowledge of driver assistance systems and automated vehicles. They are familiar with the current state of the art in driver assistance systems and automated driving functions and know about the function-determining factors. The students are able to independently plan customer-value driver assistance systems and systems for vehicle automation. |                                                      |                   |                                                          |

| After completing the module, students will be able to understand integrated circuits, their structure and mode of operation and design simple integrated circuits themselves. A further focus is on the methods of nanotechnology.                                                                                                                                                                                                                                                                                                                                 |                         |                   |                                                          |

| After completing the module, the students understand the mode of operation and know the performance characteristics of different components of optical transmission links. They can design and dimension fibre-optic transmission links.                                                                                  |                                                      |                   |                                                          |

| After completion of the module students have gained knowledge in the functional mechanisms and the design of devices for integrated optics, particularly of waveguides. They are able to apply these competences in the analysis of optoelectronic systems with regard to device and circuit level and to qualify and optimize these systems.                                                                                                                                                                                              |                                                             |                   |                                                          |

| After completion of the module students have a deeper understanding of active nonlinear microwave circuits and of the relevant semiconductor devices, as well as of the measurement technology and characterization of nonlinear circuits. They have learned methods of analytical and numerical modeling and have gained practical experience in their implementation and usage. They are able to design nonlinear microwave circuits, such as mixers and oscillators and have put this into practice on a practical example. |                                                                                                                        |                   |                                                          |

| After completing the module, students will have an in-depth understanding of electromagnetic theory for radiation fields as well as a basic understanding of wave propagation and related phenomena (e.g. Radar cross section). They have become familiar with different types of antenna elements as well as array antennas and have a clear and well-founded theoretical understanding of their electromagnetic properties and their parameters. The students have gained first experiences in the use of modern 3D-EM simulation tools and modern RF measurement techniques and are able to acquire further in-depth knowledge in the application of these tools on their own.                                                                                               |                                                         |                   |                                                          |

| After completion of the module students have a deeper understanding of passive and active linear microwave circuits, especially filters and amplifiers. They are able to design linear microwave circuits and have used respective design procedures on practical examples.                                                                                                                         |                                                                                                                        |                   |                                                          |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                             |                   |                                                          |
| <p>The module provides an overview of radar systems and their signal processing. Different radar concepts (pulse, FMCW, ...), their associated hardware, and the most important key terms and concepts of signal processing are considered. Automotive radar systems are emphasized.</p> <p>After completion of the module the students will have in-depth knowledge of radar system concepts in connection with the associated circuit concepts and signal processing and will be able to evaluate and conceptually design radar systems on this basis. Students have knowledge of the most important algorithms used in radar signal processing and have gained experience in the function and interaction of radar hardware and software. This extends from signal generation and signal acquisition to signal evaluation (range and velocity determination) and angle determination with array antennas. This enables the students to work on detailed questions in radar system development and to acquire the associated special knowledge independently.</p> |                                                             |                   |                                                          |

| After a successful participation, the students know the main basics of nonlinear photonics and will be able to use them for the evaluation of optical systems and optical data transmission systems.                                                                                                                                                           |                                                    |                   |                                                          |

| <div>After completing the module, students will have in-depth knowledge and a well-founded conceptual understanding of the theory of electromagnetic waves with respect to the solution of the homogeneous wave equation (waveguide structures) as well as of the inhomogeneous wave equation (antennas). They have become familiar with different analytical and numerical solution methods for electromagnetic problems and exemplarily implemented selected methods as well as applied them in the context of commercial 3D-EM software. They will be able to select problem-adapted solution methods and to apply them competently to electromagnetic problems.</div> <div>According to the didactic concept of the course and the design of its individual parts, interdisciplinary qualifications are conveyed and practiced. In the context of assignments, colloquia and presentations these are scientific writing and documentation, scientific discussions and presentation techniques as well as teamwork in the laboratory or within team project assignments.</div> |                                                                                                                            |                   |                                                          |

| Ray optics, wave optics, Fourier optics, electromagnetic optics, quantum optics with practical experiments on: lenses, imaging, refraction, diffraction, interferometers, determination of optical constants, polarisation, Fourier optics, holography, laser, waveguide optics, quantum optics. |                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                          |                                             |                   |                                                          |
| After completing the module, the students know the essential fundamentals of modern photonics and can apply this knowledge to the assessment, design and simulation of photonic systems. Through the practical experiments offered, the students gain additional practical experience.           |                                             |                   |                                                          |

| After completing this module, students have basic knowledge of architectures and protocol standards of communications networks and are familiar with the principles of signalling. The acquired fundamentals enable them to analyze and evaluate new protocols and switching technology procedures.                                                                                  |                                                     |                   |                                                          |

| The students are introduced to contemporary advanced topics in security systems and technology. They are able to analyze, assess and design security systems and their respective components.                                                                                                                                                                                                                                                                                                                                                                                                                |                                              |                   |                                                          |

| This class is designed for students who are interested in studying the successful deployments and the potential use of information technologies in various topics that are essential for social good, including but not limited to disaster management, broadband and digital divide, social resilience, privacy, environmental sustainability, and animal welfare.<br>After completion of this module the students own deep knowledge about topical research subjects in this area. They are able to analyze, assess and design upcoming systems and their respective components. |                                             |                   |                                                          |

Book: More playful user interfaces, Interfaces that Invite Social and Physical Interactions, Edited by Anton Nijholt, Springer 2015.

**Remark**

Prerequisites: The students are expected to have already taken courses in networking and in particular in the architecture and protocols in the Internet, broadband networks, protocols and software engineering, as well as communication technologies, such as fiber, traditional wireline and wireless networks.

| After completing this module, students will have in-depth knowledge of architectures and signaling protocols of new architecture and protocols in advanced communication networks, including the access networks, core and backone networks, optical transport networks, wireless networks and virtual private networks, such as data center networks and campus networks. The fundamentals learned enable students to design, analyze and evaluate new protocols, services and network architectures. |                                                          |                   |                                                          |

| The lecture gives a broad introduction to network security, including foundations of cryptography, message integrity, authentication, privacy and anonymity, application layer security, secure network protocols, security in the physical layer, as well as broader aspects security aspects related to reliability and safety. It also discusses relevant topics in various application domains, such as (i) security in next generation mobile networks, (ii) satellite network security; (iii) security in the compute continuum of IoT, edge and cloud computing; (v) security functions within the network management; (vi) physical layer security in optical and wireless networks. |                                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |                   |                                                          |
| On finishing this module the students have a survey of the theoretical principles of cryptography. They are able to analyze basic cryptographic systems and are able to design basic electronic security systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                              |                   |                                                          |

| Upon completion of this module, students will have in-depth knowledge of the state of the art and future research topics in the field of architectures and protocols in communication networks. The foundations in this class will help students to better understanding the interaction of complex multi-layered and heterogeneous network architectures and to learning how to engineer the network.                                                                             |                                        |                   |                                                          |

| The students are able to specify suited numerical solution procedures for electromagnetic radiation problems. The underlying approaches of the procedures are understood, as well as the herefrom resulting limits for the application and potential sources of error.                                                                                                                                                                      |                                               |                   |                                                               |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able assess the EMC product safety by failure mechanisms.    |                                             |                   |                                                               |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able to assess the EMC product safety by failure mechanisms. The students are able to investigate current EMC issues autonomously, structure and present them to an audience. |                                                                   |                   |                                                               |

| <p>All modern mobile communications applications (e.g., GSM, WLAN, GPS, Bluetooth, DECT, etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated into low-cost CMOS technology, resulting in significant differences from the classic design of high-frequency circuits based on discrete components. The lecture provides an introduction to the design of analog, integrated CMOS mobile communications receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>• High-frequency amplifier circuits</li><li>• Simulation of electronic noise</li><li>• Low-noise input amplifiers in CMOS</li><li>• Mixer circuits</li><li>• HPhase-locked loops (PLLs)</li><li>• Voltage-controlled oscillators</li></ul>                                                                                                                                                                                                                        |                                     |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                     |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p> <p>They will acquire fundamental knowledge in the use of the Spectre-RF design tool, which is widely used in industry for the design of analog integrated circuits.</p> <p>In accordance with the didactic concept of the course and the structure of the individual components, interdisciplinary skills are taught and practiced. These include scientific writing and documentation, conversation</p> |                                     |                   |                                                          |

and presentation techniques, and teamwork in the laboratory or on projects, which are covered in assignments, colloquia, and final presentations.

#### Literature

# Thomas H. Lee " The Design of CMOS Radio-Frequency Integrated Circuits", Cambridge University Press

#### Remark

For the Master's degree programs in Electrical Engineering, Industrial Engineering Electrical Engineering, and Information Systems Engineering

| <p>All modern mobile radio applications (e.g. GSM, WLAN, GPS, Bluetooth, Dect. etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated in low-cost CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture gives an introduction to the design of analog, integrated CMOS mobile radio receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>- High frequency amplifier circuits</li><li>- Simulation of electronic noise</li><li>- Low-noise input amplifiers in CMOS</li><li>- Mixer circuits</li><li>- Phase-locked loops (PLLs)</li><li>- Voltage-controlled oscillators</li></ul> |                            |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                            |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                            |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                            |                   |                                                          |
| Thomas H. Lee " The Design of CMOS Radio-Frequency Integrated Circuits" Cambridge University Press                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                            |                   |                                                          |

| Upon completion of this module, the students will acquire knowledge about integrated circuits for various biomedical applications and obtain a deep understanding about circuit techniques for design of analog integrated circuits for biomedical applications (e.g. HF-oscillators for glucose sensing).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                 |                   |                                                          |

| After completing the module, students will have an understanding of the essential processes and interrelationships involved in planning terrestrial radio networks and will have acquired knowledge of the data required for this purpose and, in particular, the algorithms, models and methods used. They will be able to solve planning tasks independently using a radio planning tool. |                                                     |                   |                                                          |

| The lecture provides the basics in the areas of the air interface of mobile communication systems. Students will acquire knowledge on the structure and functionality of cellular and wireless local area networks.                                                                          |                                             |                   |                                                          |

| The lecture deals with the basics of modern communication measurement technology. Students will learn about the measurement of signals and transmission characteristics in the time and frequency domain, antenna measurement technology, protocol measurement technology and channel measurement, which are essential for understanding and using state-of-the-art measuring devices, for example in the field of mobile communications. After completing the module, students will be able to use current measurement systems in research and development independently. |                                  |                   |                                                                                                  |

| After completing the module, students will possess advanced skills in writing a scientific paper. In the course of the advanced seminar, current research topics from the area of machine learning are discussed, deepened, and scientifically prepared. The participants will read scientific publications, present them and discuss them jointly. The structure of a scientific conference publication will be covered as well as strategies for the writing of the standard sections of a paper.<br>This course has a discursive character, therefore regular attendance of the participants is required. |                                     |                   |                                                          |

| After completing the lecture, the students will know the building blocks of complex communications networks, i.e., the multiple-access channel, the broadcast channel, the relay channel and the interference channel, their achievable rates and capacity regions including coding and decoding schemes. In addition, the students obtain knowledge to design future wireless and multi-hop as well as ad-hoc networks. They master information-theoretic and mathematical tools to prove coding theorems. They know the state of the art as well as open problems in network information theory.                                                                                                                               |                                             |                   |                                                          |

| After successful completion of the module, students will be able to classify time series (e.g., speech signals) using hidden Markov modeling. The students acquire all the necessary knowledge to suitably select, design, and evaluate methods and algorithms for automatic speech recognition to solve problems in practice.                                                                                                                                                                                                                                                                                                                            |                                                                                       |                   |                                                          |

| This module from the master's program is also suitable for bachelor students. Basic knowledge of digital signal processing, as e.g. acquired in the module #digital signal processing#, facilitates the understanding of this lecture.                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                       |                   |                                                          |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |            |                  |                 |

| Upon completion of this module, students gain fundamental knowledge about methods and algorithms for classification of data. They are capable to select the appropriate means for real-world problems, to design a solution and to evaluate it.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                           |                   |                                                          |

| <div>- Direct data transmission by PhySec: It covers multi-user communications with an additional secrecy constraint. For example, wiretap channels, broadcast channels with confidential messages, etc., and we will analyze the secrecy capacity/capacity region of these channels.</div> <div>- Key generation by PHYSEC: It covers the secret key generation with the source model and the channel model. In the former case, the legitimate users will observe a common source of randomness and try to agree on a secret key, which is unknown to a potential eavesdropper. In the latter one, one of the legitimate users transmits a random sequence through the channel to the other users and again they try to agree on a key. Practical sequential key distillation will also be covered.</div> <div>- Authentication: It covers how to identify the legitimate communication partners by channel testing/probing or by the use of the physically unclonable functions.</div> |                                                                               |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                               |                   |                                                          |
| In this course, we aim to show/provide a rigorous way to develop a security system on the physical layer (PhySec), by taking the physical properties of the communication environments into account. After having attained this course, the students are able to answer questions about a system's security with a fundamental knowledge about physical layer security.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                               |                   |                                                          |

| The lecture provides an introduction to the fundamentals of Shannon information theory. The goal is that students can derive the main information theoretic results on maximal achievable lossless (source coding) and lossy (rate distortion theory) compression of data and on maximum data rates for reliable data transmission (channel coding). The methods and tools required, e.g., information measures (entropy, mutual information, capacity etc.) and their properties (typical sequences) will be covered as well as practical applicable simple codes (block, turbo and polar codes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                             |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                             |                   |                                                          |

| Students will learn how to use more advanced mathematical tools to analyze more complicated issues in physical layer security, continuing the discussion from the lecture Physical Layer Security. More specifically, the sequential key distillation for secret key generation, privacy issues tackled by physical layer schemes, and the more general setting where the eavesdropper is active, are included in this lecture.                                      |                                              |                   |                                                          |

| On completion of this module, students will have deepened their knowledge from the course 'Computer Networks 1'. They will be familiar with the processes used on the Internet and the procedures involved.                                                                                   |                                                                                       |                   |                                                 |

| <p>Data converters bridge digital virtual space and analog real world in cyber physical system (CPS), and become key building circuit blocks. This lecture deals with the circuit design of CMOS data converters. In particular, circuit techniques related to low-power and high-resolution ADCs, which are important for sensor signal detection in IoT application, will be explained. It is assumed that the students have basic knowledge of CMOS integrated circuit design and signal processing such as Laplace transform and Z transform.</p> <p>General introduction of data converters</p> <p>1. Data converter application areas</p> <p>Sensor interface, Communication (wireless/wireline)</p> <p>2. Basic theory in data conversion</p> <p>Sampling/Quantization, Performance metric (INL/DNL, SNDR, SFDR, ENOB, FoM)</p> <p>3. Architectures and features of data converters</p> <p>2-1. High resolution data converter (SAR, ##, VCO based)</p> <p>2-2. High speed data converter (Flash, Pipeline)</p> <p>Implementation of low-power and high-resolution CMOS integrated ADCs</p> <p>4. Building blocks of ADC</p> <p>Comparator, operational amplifier</p> <p>5. SAR-ADC with charge redistribution.</p> <p>3-1. Power reduction techniques</p> <p>3-2. Resolution enhancement techniques (digital calibration etc.)</p> <p>6. High resolution ## modulator</p> <p>7. Time based (VCO based) ADC</p> <p>8. Hybrid-ADC</p> <p>9. Characterization of data converters</p> |                                              |                   |                                                          |

| Students have basic knowledge of modern computer architectures and an understanding of the function of modern computers. With the knowledge they have acquired, they are able to configure computer systems on a component basis and evaluate their performance.                                |                                                      |                   |                                                          |

In addition, the modules “VLSI Design” and “Verification, Validation and Testing of ASIC Designs” are recommended to attend in parallel during the realization of this laboratory. |                   |                               |
| Expected performance/ Type of examination                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                        |                   |                               |

| <p>The Chip Design Laboratory is divided into three successive phases. All phases of the laboratory consist of interactive self-study and seminars. The latter provide students with the knowledge necessary to work on the tasks in small groups in self-study. During the independently organized work in the groups on a defined task (self-study), a research associate of the institute checks the progress and gives assistance if necessary. Phase 0: Chip conception and specification The hardware modules to be implemented in phase 1 are designed and specified in small groups during this phase. This phase is based on the target application to be executed on the hardware. The application as well as the hardware modules in form of a microcontroller, peripheral modules and co-processors are selected and all necessary features of these are summarized and documented in this phase. Phase 1: Module implementation and verification At the beginning of phase 1, the students implement individual hardware modules specified in phase 0, i.e., a microcontroller, peripheral modules and co-processors, in small groups using VHDL. The knowledge from previous courses, which is required for VHDL design and testbenches (with System-C), is refreshed and extended in two seminars. Phase 2: Chip design and prototyping After the module development, different groups perform: • functional verification and emulation using a FPGA evaluation board (in-circuit emulation), • performing a complete ASIC synthesis and back-end flow based on a library of standard cells, and • porting a small application onto the system...</p> |                                                                                                                                                                                                                                                                                                        |                   |                               |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                        |                   |                               |

In this laboratory, students design digital circuits using a RISC-V microcontroller with</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                        |                   |                               |

peripheral modules. During the different phases of the lab, the students design, specify, implement and verify digital circuits with hardware description languages, industrial EDA tools, System-C testbenches and hardware test setups. The qualification goals taught in this laboratory are successful project work in the field of digital circuit design from the specification to the in-circuit test of the designed circuit. The students gain knowledge about project planning, development work and teamwork. At the same time, students acquire specialized knowledge in their own work with used tools and hardware description languages. The goal is the successful and self-developed completion of the project and the exchange of the knowledge gained in teamwork.

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                  |                   |                               |
| This lecture deals with the design of digital circuits in CMOS technology. The students learn about alternative techniques for the realization of basic circuits as well as their manufacturing and design process. By using practical examples, various forms of implementation of integrated circuits are discussed and current challenges of today's chip development in modern semiconductor technologies are presented. After completing the module, students are able to independently design VLSI chips.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                  |                   |                               |

| The students know the basic design of complex electronic systems at high level of abstractions. This includes the optimized partitioning, scheduling and evaluation of mixed hardware and software design solutions dedicated to embedded systems. The students understand about advanced related topics in HW/SW codesign and performance analysis for safety critical and real-time embedded systems. Starting from simple system specification the students can use tools for partitioning, optimization and performance analysis to synthesize the hardware/software system. |                                                                                                                                                                                          |                   |                                                          |

| Upon completion of this module, students will have in-depth knowledge of the state of the art and future research topics in the field of architectures and protocols in communication networks. The foundations in this class will help students to better understanding the interaction of complex multi-layered and heterogeneous network architectures and to learning how to engineer the network.                                                                             |                                        |                   |                                                          |

| Contents                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                              |                   |                                                          |
| <p>In this course, students will learn about the leading contenders for post-silicon storage-class and main memory technologies. Decades of research have yielded several efficient memory device working principles, including phase-change of the structure (PCM), materials conversion (OxRAM), ion diffusion (CBRAM), magnetic properties (STT-MRAM, MTJ), and ferroelectricity (FRAM, FeFET). Currently, these memory technologies are transitioning from research to industry, and are predicted to have at least niche applications in the ever-growing hardware market. Some technologies, such as PCM, may even eventually surpass silicon-based flash memory, providing better performance and unique features.</p> <p>Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.</p> |                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |                   |                                                          |
| <p>After successfully completing the module, students will understand the biological principles of neural information processing and their differences to the von Neumann architecture. They know the basic methods for hardware implementation of neuromorphic systems. They will also be able to design simple neuromorphic algorithms for specific applications and analyze their performance. Finally, they will be able to evaluate the strengths, weaknesses and current developments of neuromorphic systems and assess their potential for various application areas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                              |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                              |                   |                                                          |

| <p>Neuromorphic computing is an approach which is inspired by the structure and function of human brains. Neuromorphic computers are based on Silicon devices which use physical artificial neurons and synapses to apply computations. In recent times, the term neuromorphic has been used to describe analog, digital, mixed-mode analog/digital VLSI, and software systems that implement models of neural systems. The implementation of neuromorphic computing on the hardware level can be realized by oxide-based resistive or ferro-electric memristors.</p> <p>The lecture presents the principles of biological computation and their implementation in hardware. Basic building blocks of neuromorphic technology are presented. The implications for the development of novel information processing technologies are outlined.</p> |                                      |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                      |                   |                                                          |
| After successfully completing the module, students will have understand the principles of biological computation. They will know how to implement them in hardware. They will have basic skills in applying neuromorphic engineering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                      |                   |                                                          |

| Upon completion of the module, students will have a comprehensive understanding of the fundamentals and advanced concepts of phase-locked loops (PLLs) and frequency synthesis. They will be familiar with the systematic architecture of various PLL types, including analog and digital integer PLLs as well as fractional PLLs. Students will understand the causes and effects of jitter and phase noise, and will be able to evaluate and minimize them. They will be acquainted with specialized circuits such as Costas loops, delay locked loops (DLL), numerically controlled oscillators (NCOs), and software-based PLL implementations. The knowledge they acquire enables students to independently research related topics and apply theory to practice. This allows them to analyze and solve practical problems independently. |                                             |                   |                                                          |

| Die Studierenden lernen Techniken zur Verifikation, Validierung und dem Testen von ASIC-Designs kennen. Auf Basis von praktischen Beispielen und aktuellen Entwicklungswerkzeugen werden die Studierenden an Herausforderungen der heutigen Chipentwicklung und dem Testen herangeführt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                      |                   |                                      |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                      |                   |                                      |

| This course focusses on the main challenges for the design of modern semiconductor storage systems under the aspect of rapidly growing data storage requirements. Current, volatile and non-volatile memory types will be covered from the fundamental semiconductor technology level up to higher levels of system-level abstraction, with a focus on reliability and protection of stored data. Furthermore, Processing-in-Memory Architectures (PIM) based on conventional and 3D-stacked memories are analyzed, taking into account aspects such as low latency and energy consumption. |                                                                                                             |                   |                               |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                             |                   |                               |

| After completing the module, the students know how to design and optimize complex circuits on modern FPGA devices. Moreover, they are capable to efficiently use all the embedded dedicated hardware modules, e.g., DSPs, different embedded memories, I/O high speed interfaces, or analog-to-digital converters. This course makes emphasis on the design of high performance circuits by understanding the FPGA architecture limitations and including dynamic and partial reconfiguration mechanisms. The students will be introduced to emerging reconfigurable logic devices and their use in demanding technical applications. |                                                                                                                                              |                   |                               |

| Students understand the models of DC and AC motor drives and the mathematical concept of space vectors and can utilise them in simulations. They know the control structures for the motor types DC motor, asynchronous machine and synchronous machine with and without speed sensor. They can design and analyse their own control structures and tune the control parameters. They understand sensors commonly used in drive systems like compensated current sensor, resolver, incremental angular sensor and the corresponding evaluation functions. They can use the principle of space vector modulation and similar modulation methods to design their own hardware and software. |                                                                                  |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                              |                   |                                                          |
| After completing the module, students will acquire knowledge of legal requirements regarding electromagnetic compatibility. They will learn the structure, function, application and design of passive and active filter circuits. An important aspect here is to obtain a mains current that is as sinusoidal as possible in phase with the mains voltage with the help of so-called power factor correction (PFC). Students should understand how resonant power converters and quasi-resonant circuits work and how they are used, also by means of simulations. Finally, they should be able to understand the structure and function of multi-level converters. They will be able to conceptually design, dimension and analyse (also by simulation) corresponding assemblies. |                                              |                   |                                                          |

| <p>The students have fundamental knowledge of Power Systems and special or in-depth expertise for High-Voltage Systems Engineering.</p> <p>They learn methods with the help of discipline experiments and simulations and interpret / evaluate texts and data from Power Systems.</p> <p>They are able to make scientifically sound judgments within the scope of High-Voltage and formulate research problems.</p> <p>The students are able to select an adequate level of abstraction for a given research problem and work on that level.</p> <p>They can assess the scientific value of High-Voltage research and can formulate development or application problems.</p> <p>For Power Systems Engineering they have a systematic approach characterized by the application and development of theories, models and coherent interpretations and they can use scientific theories / model concepts.</p> <p>They reflect critically on their own way of thinking, their decisions and actions and are able to think logically (recognize</p> |                                                                                                            |                   |                                                             |

fallacies and deceptions) and critically interpret scientific data (origin, completeness, relevance, etc.) and formulate a wellfounded opinion.  
 They can communicate to others in writing and orally the results of the scientific work in the given examples and behave professionally (in the sense of reliability, commitment, correctness, precise work, perseverance, independence, etc.).  
 The students work task-related and target-oriented in the learning group and deal with group-dynamic processes. They analyze social, economic or cultural consequences of new developments in High-Voltage Transmission.

| Objective qualification                                                                                                                                                                                                                                                          |                                              |                   |                                                             |
| After completing the module, students will be able to understand the structure and operation of electrical power supply networks from extra-high to low voltage. The basics they have learnt enable them to independently analyse networks in the event of operation and faults. |                                              |                   |                                                             |

| After successful completion of the module, students will have knowledge of key technologies, structure and function of future power grids. They are able to understand their complex interaction and derive requirements for components in order to ensure the operation and protection of the power grids in a wide variety of system states. In addition, they are able to apply the knowledge imparted in the design of switches at all voltage levels for direct and alternating current of the power grids. On the basis of excursions and exercises, the knowledge is applied and insights into practice are provided. |                                       |                   |                                                             |

| After completing the module, students have a basic overall understanding of the control of conventional and renewable energy generation systems and the control of electrical grids. Physical principles of power transmission and mechanisms for maintaining stationary and dynamic grid stability are learnt. Students will be familiar with methods for controlling grids and synchronous generators as well as for hardware-based and higher-level control of converter-coupled renewable energies. This enables students to assess these in terms of their effect on grid stability. Students are also able to simulate the control of conventional power plants and renewable energies as well as power grids. Furthermore, they are able to transfer technical grid connection requirements into control mechanisms and develop grid functions.        |                                                                                          |                   |                                                             |

| Students understand the models of DC and AC motor drives and the mathematical concept of space vectors and can utilise them in simulations. They know the control structures for the motor types DC motor, asynchronous machine and synchronous machine with and without speed sensor. They can design and analyse their own control structures and tune the control parameters. They understand sensors commonly used in drive systems like compensated current sensor, resolver, incremental angular sensor and the corresponding evaluation functions. They can use the principle of space vector modulation and similar modulation methods to design their own hardware and software. |                                                                                  |                   |                                                          |

| After completing the Electrical Drives module, students will have an overview of the functions of the most important DC and mmost important direct current and rotating field machines. The in-depth fundamentals enable the assessment of existing motor and generator drives as well as the design of simple drive systems for industry and mobile applications. |                                                      |                   |                                                          |

| After completing the module, students will have acquired basic knowledge of the structure, function, application and design of passive components in power electronics. They will be able to independently design and dimension complete power electronics circuit arrangements.                                                                                                           |                                              |                   |                                                          |

| After completing the module, the students have in-depth knowledge of the function of rotating electric machines and the physical intervention options for speed control. The deepened fundamentals enable the design of simple drives taking into account possible fault conditions as well as the entry into the design of electrical machines.                                                                                                                                      |                                              |                   |                                                          |

| The module teaches a system-oriented approach to the design of electric drives in road vehicles by considering the vehicle as a mechatronic system. Starting from the basics of drive design (driving resistances, power transmission), common drive topologies of road vehicles are dealt with. Special features of the motors used with regard to their function and their properties as inverter-fed drives are dealt with. The knowledge gained here on the design and dimensioning of traction drives is then applied to road vehicles (electric and hybrid vehicles). |                                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                              |                   |                                                          |
| After completing the module, the students know the essential structures of conventional and new types of vehicle drives and the electrical machines and converters used in these vehicles. They are also able to carry out a simple design.                                                                                                                                                                                                                                                                                                                                 |                                              |                   |                                                          |

| After completing the module, students will acquire knowledge of legal requirements regarding electromagnetic compatibility. They will learn the structure, function, application and design of passive and active filter circuits. An important aspect here is to obtain a mains current that is as sinusoidal as possible in phase with the mains voltage with the help of so-called power factor correction (PFC). Students should understand how resonant power converters and quasi-resonant circuits work and how they are used, also by means of simulations. Finally, they should be able to understand the structure and function of multi-level converters. They will be able to conceptually design, dimension and analyse (also by simulation) corresponding assemblies. |                                              |                   |                                                          |

| After completing the module, students will be able to derive the requirements for power electronics from the requirements of an application. They will learn to create concepts for power electronics and to analyse and design suitable circuits. Building on the basic knowledge from the previous power electronics modules (Fundamentals of Power - part of GENT - and Basic Circuits of Power Electronics), alternative circuits are presented and analysed. The knowledge of power electronic components is expanded and supplemented by aspects of reliability and service life. |                                              |                   |                                                          |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able assess the EMC product safety by failure mechanisms.    |                                             |                   |                                                               |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                   |                   |                                                               |
| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able to assess the EMC product safety by failure mechanisms. The students are able to investigate current EMC issues autonomously, structure and present them to an audience. |                                                                   |                   |                                                               |

| The lecture provides an overview of the requirements for the system components of grid-connected and off-grid photovoltaic systems without and with decentralised battery storage, for example to maximise self-consumption. Due to subsidy programmes and the sharp drop in prices, photovoltaics are becoming increasingly important for the electrical energy supply in Germany (30 gigawatts installed by 2013, share of up to 30 % of the midday load). Special attention is paid to inverter technology with a comparison of the properties of different circuit topologies and their effects on PV system design. In the exercise, PC tool-based system designs and their grid integration are calculated. The lecture is rounded off with a free one-day excursion to the international market and technology leader for solar inverters in Kassel. On completion of the module, students will be able to analyse, assess, design and dimension components and PV systems and their integration into the grid. |                                                                                         |                   |                                                          |

A free one-day excursion to Alstom Transport Deutschland in Salzgitter and to another destination is also offered.

### Objective qualification

After completing the module, students will be able to understand electrical railway systems with regard to the functioning of their components and to evaluate their properties.

| On completion of the module, students will have acquired knowledge of the energy industry in Germany. They will be able to evaluate and assess current developments in the markets. New technologies and research insights are integrated.    |                                                     |                   |                                                             |

| <div>Upon completion of this course, the students shall understand:</div> <div>- The main differences between AC and DC transmission</div> <div>- The main components of HVDC systems</div> <div>- The operation principles of different power semiconductor devices</div> <div>After completing the course, the candidate should be able to:</div> <div>-Establish and modeling of AC and DC sources</div> <div>-Modeling of half wave and full wave rectifiers</div> <div>-Modeling of DC-DC buck converter</div> <div>-Modeling of DC-DC boost converter</div> <div>-Modeling of single phase thyristor converter</div> <div>-Modeling of three phase thyristor converter</div> <div>-Modeling of pulse width modulation (PWM)</div> <div>-Modeling of HVDC link</div> |                                                     |                   |                                                             |

The students will also be able to use PSCAD simulation software in order to simulate different converter models, plotting and analyzing the results. The following abilities should be enhanced through joining the course:

- Work independently and in groups
- Use PSCAD software
- Design and operation of DC-DC converters
- Principles of operation of thyristor single and three phase converters
- Basic principles of controlling HVDC systems
- Fault analysis in HVDC systems
- Operation and control of MTDC systems
- Operation of VSC converters

#### Literature

1. High-Voltage Direct-Current Transmission # Converters, Systems and DC Grids (Dragan Jovcic)
2. HVDC Technology: An Introduction (Michael Kurrat, TU Braunschweig)
3. Power Electronics: A first Course (Ned Mohan)
4. Power System Stability and Control (Prabha Kundur)
5. PSCAD Users Guide

#### Remark

It is recommended that students who intend to join this course have already joined the following courses: Elektrische Energieanlagen I, Grundlagen der elektrischen Energietechnik, Grundlagen der Regelungstechnik

| After successful completion of the module, students will have a basic knowledge of the structure and function of DC- systems. They are familiar with the hazards and the necessary safety measures and regulations in DC-networks. Industrial networks, data centers and on-board networks are typical applications. By means of experiments and simulations, the students learn practical knowledge.                                                                            |                                                                                        |                   |                                                             |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                           |                   |                                                             |
| After successful completion of the module, students have a basic knowledge of the structure and function of storage systems.<br>They are informed about current and future developments in storage systems and can formulate existing challenges.<br>Students learn practical skills through excursions and exercises.                                                                                                                                     |                                                           |                   |                                                             |

| <p>The students have fundamental knowledge of Power Systems and special or in-depth expertise for High-Voltage Systems Engineering.</p> <p>They learn methods with the help of discipline experiments and simulations and interpret / evaluate texts and data from Power Systems.</p> <p>They are able to make scientifically sound judgments within the scope of High-Voltage and formulate research problems.</p> <p>The students are able to select an adequate level of abstraction for a given research problem and work on that level.</p> <p>They can assess the scientific value of High-Voltage research and can formulate development or application problems.</p> <p>For Power Systems Engineering they have a systematic approach characterized by the application and development of theories, models and coherent interpretations and they can use scientific theories / model concepts.</p> <p>They reflect critically on their own way of thinking, their decisions and actions and are able to think logically (recognize</p> |                                                                                                            |                   |                                                             |

fallacies and deceptions) and critically interpret scientific data (origin, completeness, relevance, etc.) and formulate a wellfounded opinion.  
 They can communicate to others in writing and orally the results of the scientific work in the given examples and behave professionally (in the sense of reliability, commitment, correctness, precise work, perseverance, independence, etc.).  
 The students work task-related and target-oriented in the learning group and deal with group-dynamic processes. They analyze social, economic or cultural consequences of new developments in High-Voltage Transmission.

| Objective qualification                                                                                                                                                                                                                                                          |                                              |                   |                                                             |
| After completing the module, students will be able to understand the structure and operation of electrical power supply networks from extra-high to low voltage. The basics they have learnt enable them to independently analyse networks in the event of operation and faults. |                                              |                   |                                                             |

| After completing the module, students will be able to describe the conventional and sustainable provision of electrical energy as well as associated current and future developments on the basis of basic knowledge. In addition to the provision of electrical energy, students will be able to identify various approaches to sector coupling (transport, heat) and possibilities for storing energy (battery storage, hydrogen, etc.). This module enables students to explain future requirements and changes in the energy system and to list possible advantages and disadvantages. Measures and goals in the context of potential transformations (energy transition, mobility transition, etc.) can be classified and assessed in the overall context of a sustainable energy supply. |                                             |                   |                                                             |

| After successful completion of the course, students have a fundamental understanding of latest and future technologies that are relevant for the transmission of electrical energy. They are informed about current and future developments regarding transmission grids and are able to formulate existing challenges. Students are also able to analyze, assess and design technologies, components, and systems on a fundamental level. |                                                  |                   |                                                             |

| Students know and understand in-depth methods of battery technology, including the characterization, analysis and simulation of batteries. Students will be able to apply the basic knowledge they have already acquired in other modules, e.g. the structure and function of storage systems. They have the ability to collect, document and evaluate experimental data from various battery test cells and to cooperate successfully with fellow students. Students are able to make scientifically sound judgments in the context of battery technologies. Draw new conclusions from their own results and the state of knowledge in the literature. This scientific work must be presented orally and in writing. |                                                                                  |                   |                                                             |

| After successfully completing the module, students will have basic knowledge of technologies that are relevant to the distribution of electrical energy now and in the future. They are informed about current and future developments in electrical energy distribution networks and can formulate existing challenges. They are able to analyse and assess technologies, components and systems and to design and dimension them in principle.                                                          |                                            |                   |                                                             |

| After successful completion of the module, students will have knowledge of key technologies, structure and function of future power grids. They are able to understand their complex interaction and derive requirements for components in order to ensure the operation and protection of the power grids in a wide variety of system states. In addition, they are able to apply the knowledge imparted in the design of switches at all voltage levels for direct and alternating current of the power grids. On the basis of excursions and exercises, the knowledge is applied and insights into practice are provided. |                                       |                   |                                                             |

| After completion of the module students have gained knowledge in the functional mechanisms and the design of devices for integrated optics, particularly of waveguides. They are able to apply these competences in the analysis of optoelectronic systems with regard to device and circuit level and to qualify and optimize these systems.                                                                                                                                                                                              |                                                             |                   |                                                          |

| After a successful participation, the students know the main basics of nonlinear photonics and will be able to use them for the evaluation of optical systems and optical data transmission systems.                                                                                                                                                           |                                                    |                   |                                                          |

| <p>All modern mobile radio applications (e.g. GSM, WLAN, GPS, Bluetooth, Dect. etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated in low-cost CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture gives an introduction to the design of analog, integrated CMOS mobile radio receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>- High frequency amplifier circuits</li><li>- Simulation of electronic noise</li><li>- Low-noise input amplifiers in CMOS</li><li>- Mixer circuits</li><li>- Phase-locked loops (PLLs)</li><li>- Voltage-controlled oscillators</li></ul> |                            |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                            |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                            |                   |                                                          |

| <p>The course builds on ‘Lighting Technology I’. While Lighting Technology I focusses on general questions of lighting and lighting technology, this course discusses LED technology and gallium nitride technology in particular:</p> <ul style="list-style-type: none"><li>• Physical principles of LEDs. Band gap engineering in LEDs.</li><li>• Semiconductor materials for optoelectronics</li><li>• Relationship between material properties and LED properties</li><li>• Manufacturing processes</li><li>• Efficiency considerations</li><li>• Front-end and back-end processing</li><li>• Application examples in general lighting, automotive technology, sensor technology</li><li>• Infrared LEDs, visible light, UV LEDs</li></ul> |                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                             |                   |                                                          |
| <p>After completing the module, students will have an overview of the current state of LED technology and the development opportunities that solid state lighting will offer in the future. In addition, they will have a basic understanding of the physical processes within LEDs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                             |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                             |                   |                                                          |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                             |                   |                                                          |
