| After completing the module 'Nanoelectronics', students will have an overview of the fundamentals of quantum mechanics and its application to metallic, magnetic and superconducting components with nanometre dimensions.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                   |                   |                                                                        |

| <p>After completing the module, students will be able to understand integrated circuits, their structure and mode of operation and design simple integrated circuits themselves. A further focus is on the methods of nanotechnology.</p>                                                                                                                                                                                                                                                                                                                          |                         |                   |                                                          |

| <p>Concepts of quantum physics have been developed at the beginning of 20th century, and developed into a comprehensive foundation of physics. Quantum technologies are already used in applications today, like e.g. semiconductor devices, laser devices or satellite navigation. The quantum principles of the first generation of applications are based on the concepts of coherence. Potential technologies of the second generation of quantum technologies will extend towards the manipulation of single quantum objects and will use many particle systems and entanglement. In a joint statement on the importance and commercialization of quantum technologies, the German Academies of Sciences urgently suggest to merge quantum technologies and engineering education. This is the goal of the lecture #Advanced quantum technologies for engineers#. It lays out the basis for an understanding of quantum effects, dealing with the following topics: quantum physics as scientific theory, principles of quantum theory, quantum technologies of 1. and 2. generation. Further information can be found in #Perspectives of quantum technologies# [gemeinsame Stellungnahme von Leopoldina, acatech und Union der deutschen Akademien der Wissenschaften, ISBN 978-3-80473343-5, online available]</p> |                                                      |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                      |                   |                                                          |
| Knowledge in the basic concepts of quantum physics, basic knowledge in quantum optics, quantum electronics, optoelectronics and laser physics, quantum statistics, spinelectronics as a basis for future applications of quantum technologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                      |                   |                                                          |

| Students are familiar with the fundamentals of organic chemistry. They can explain the structure of molecular orbitals and describe the different hybridization states of carbon atoms in the context of LCAO. They analyze the electron transfer between different molecules in the framework of the Marcus theory and can describe the essential aspects of electronic tunneling processes. They understand the content of current research publications and present them in short presentations. They can describe the structure of conductive polymers, their doping and electronic transport. They analyze the optoelectronic properties of polymers and organic dyes and can classify and explain the relevant electronic excitations and processes. |                         |                   |                                                          |

| After completing the module, the students understand the mode of operation and know the performance characteristics of different components of optical transmission links. They can design and dimension fibre-optic transmission links.                                                                                  |                                                      |                   |                                                          |

| After completion of the module students have deeper understanding of solid state physics of dielectrics, semiconductors, and metals. They developed the capability to design electronic and optoelectronic devices.                                                                                                                                                                                                                                                                            |                                                              |                   |                                                          |

| After completion of the module students have gained knowledge in the functional mechanisms and the design of devices for integrated optics, particularly of waveguides. They are able to apply these competences in the analysis of optoelectronic systems with regard to device and circuit level and to qualify and optimize these systems.                                                                                                                                                                                              |                                                             |                   |                                                          |

| After a successful participation, the students know the main basics of nonlinear photonics and will be able to use them for the evaluation of optical systems and optical data transmission systems.                                                                                                                                                           |                                                    |                   |                                                          |

| Ray optics, wave optics, Fourier optics, electromagnetic optics, quantum optics with practical experiments on: lenses, imaging, refraction, diffraction, interferometers, determination of optical constants, polarisation, Fourier optics, holography, laser, waveguide optics, quantum optics. |                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                          |                                             |                   |                                                          |
| After completing the module, the students know the essential fundamentals of modern photonics and can apply this knowledge to the assessment, design and simulation of photonic systems. Through the practical experiments offered, the students gain additional practical experience.           |                                             |                   |                                                          |

| The students are able to specify suited numerical solution procedures for electromagnetic radiation problems. The underlying approaches of the procedures are understood, as well as the herefrom resulting limits for the application and potential sources of error.                                                                                                                                                                      |                                               |                   |                                                               |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able assess the EMC product safety by failure mechanisms.    |                                             |                   |                                                               |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able to assess the EMC product safety by failure mechanisms. The students are able to investigate current EMC issues autonomously, structure and present them to an audience. |                                                                   |                   |                                                               |

| <p>All modern mobile communications applications (e.g., GSM, WLAN, GPS, Bluetooth, DECT, etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated into low-cost CMOS technology, resulting in significant differences from the classic design of high-frequency circuits based on discrete components. The lecture provides an introduction to the design of analog, integrated CMOS mobile communications receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>• High-frequency amplifier circuits</li><li>• Simulation of electronic noise</li><li>• Low-noise input amplifiers in CMOS</li><li>• Mixer circuits</li><li>• HPhase-locked loops (PLLs)</li><li>• Voltage-controlled oscillators</li></ul>                                                                                                                                                                                                                        |                                     |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                     |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p> <p>They will acquire fundamental knowledge in the use of the Spectre-RF design tool, which is widely used in industry for the design of analog integrated circuits.</p> <p>In accordance with the didactic concept of the course and the structure of the individual components, interdisciplinary skills are taught and practiced. These include scientific writing and documentation, conversation</p> |                                     |                   |                                                          |

and presentation techniques, and teamwork in the laboratory or on projects, which are covered in assignments, colloquia, and final presentations.

**Literature**

# Thomas H. Lee " The Design of CMOS Radio-Frequency Integrated Circuits", Cambridge University Press

**Remark**

For the Master's degree programs in Electrical Engineering, Industrial Engineering Electrical Engineering, and Information Systems Engineering

**Related courses**

**Rules for the choice of courses**

Requirements for this module: circuit technology (*Schaltungstechnik*, ST)

**Compulsory attendance**

| <p>All modern mobile radio applications (e.g. GSM, WLAN, GPS, Bluetooth, Dect. etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated in low-cost CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture gives an introduction to the design of analog, integrated CMOS mobile radio receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>- High frequency amplifier circuits</li><li>- Simulation of electronic noise</li><li>- Low-noise input amplifiers in CMOS</li><li>- Mixer circuits</li><li>- Phase-locked loops (PLLs)</li><li>- Voltage-controlled oscillators</li></ul> |                            |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                            |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                            |                   |                                                          |

| Upon completion of this module, the students will acquire knowledge about integrated circuits for various biomedical applications and obtain a deep understanding about circuit techniques for design of analog integrated circuits for biomedical applications (e.g. HF-oscillators for glucose sensing).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                 |                   |                                                          |

| <p>Data converters bridge digital virtual space and analog real world in cyber physical system (CPS), and become key building circuit blocks. This lecture deals with the circuit design of CMOS data converters. In particular, circuit techniques related to low-power and high-resolution ADCs, which are important for sensor signal detection in IoT application, will be explained. It is assumed that the students have basic knowledge of CMOS integrated circuit design and signal processing such as Laplace transform and Z transform.</p> <p>General introduction of data converters</p> <p>1. Data converter application areas</p> <p>Sensor interface, Communication (wireless/wireline)</p> <p>2. Basic theory in data conversion</p> <p>Sampling/Quantization, Performance metric (INL/DNL, SNDR, SFDR, ENOB, FoM)</p> <p>3. Architectures and features of data converters</p> <p>2-1. High resolution data converter (SAR, ##, VCO based)</p> <p>2-2. High speed data converter (Flash, Pipeline)</p> <p>Implementation of low-power and high-resolution CMOS integrated ADCs</p> <p>4. Building blocks of ADC</p> <p>Comparator, operational amplifier</p> <p>5. SAR-ADC with charge redistribution.</p> <p>3-1. Power reduction techniques</p> <p>3-2. Resolution enhancement techniques (digital calibration etc.)</p> <p>6. High resolution ## modulator</p> <p>7. Time based (VCO based) ADC</p> <p>8. Hybrid-ADC</p> <p>9. Characterization of data converters</p> |                                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                              |                   |                                                          |

After completing the module, students will be able to characterise light sources and illuminants, optimise their efficiency and solve simple lighting technology problems with the help of their parameters.

| After completing the module, students will have an overview of the current state of LED technology and the development opportunities that solid state lighting will offer in the future. In addition, they will have a basic understanding of the physical processes within LEDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                             |                   |                                                          |

| The students are able to explain the physical fundamentals of crystalline solids relevant to semiconductor optics. They acquire a detailed understanding of the interaction between light and matter, with a focus on the optical properties of semiconductors. The students gain an overview of exciton physics, particularly in 2D semiconductors, including discussions of current research topics.         |                                                                                                                                 |                   |                                                          |

| <p>Upon completion of the module, students will have a comprehensive understanding of the fundamentals and advanced concepts of phase-locked loops (PLLs) and frequency synthesis. They will be familiar with the systematic architecture of various PLL types, including analog and digital integer PLLs as well as fractional PLLs. Students will understand the causes and effects of jitter and phase noise, and will be able to evaluate and minimize them. They will be acquainted with specialized circuits such as Costas loops, delay locked loops (DLL), numerically controlled oscillators (NCOs), and software-based PLL implementations. The knowledge they acquire enables students to independently research related topics and apply theory to practice. This allows them to analyze and solve practical problems independently.</p> |                                             |                   |                                                          |

#### Contents

With a focus on optical and electrical characterisation methods, procedures for the investigation of materials and devices from the field of semiconductor technology are presented:

1. optical spectroscopy and microscopy methods
  1. absorption spectroscopy
  2. fluorescence spectroscopy
  3. time-resolved spectroscopy
  4. IR spectroscopy
  5. Raman spectroscopy and microscopy
  6. photon correlation spectroscopy
2. scanning electron microscopy
3. x-ray diffraction
4. atomic force microscopy
5. electrical measurement techniques
  1. IV
  2. CV
  3. hall effect measurements
  4. Electrical measurement methods in the atomic force microscope

The methods are each explained on the basis of application fields with typical material systems, whereby silicon, III-V/II-VI semiconductors, group III nitrides and common substrate materials (SiC, sapphire) are discussed.

#### Objective qualification

Students are familiar with important optical, electrical and other characterisation methods used in the field of semiconductor technology. They will be able to select suitable methods for specific materials and components and explain and evaluate the information that can be obtained in each case. They will be able to describe the fundamental processes in the material in the respective measurement methods using technical terminology and will be able to plot, analyse and discuss individual measurement results provided.

| After completing the module 'Sensors for non-electrical quantities', students will have an overview of the use and dimensioning of electrical sensors for non-electrical quantities. The in-depth fundamentals enable the selection, use and error assessment of modern sensors. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary qualifications are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                          |                   |                                                                        |

| After completing the module 'Digital Measurement Data Processing with Microcomputers', students will have an overview of the functionality and programming of microcontrollers for measurement data processing. The acquired practical knowledge enables the programming of embedded systems for metrological applications. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary skills are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                          |                   |                                                                        |

| Students will be familiar with the functionality of modern laser systems used in the field of semiconductor technology and can explain their mode of operation based on theoretical models. They can describe the interaction of laser light with matter theoretically. They analyze optical emission spectra (luminescence, plasma, Raman scattering, time-resolved signals) and can draw conclusions about material and interaction processes. They know the basic processes of laser material processing, especially with modern ultrashort pulse lasers. They can describe nonlinear optical processes theoretically and understand their significance for laser-based methods in semiconductor technology. They record optical spectra from laser-based processes under guidance and independently prepare a scientific evaluation and interpretation, which they present in a short presentation. |                                                                                           |                   |                                                          |

| The lecture deals with the basics of modern communication measurement technology. Students will learn about the measurement of signals and transmission characteristics in the time and frequency domain, antenna measurement technology, protocol measurement technology and channel measurement, which are essential for understanding and using state-of-the-art measuring devices, for example in the field of mobile communications. After completing the module, students will be able to use current measurement systems in research and development independently. |                                  |                   |                                                                                                  |

| <p>The course builds on ‘Lighting Technology I’. While Lighting Technology I focusses on general questions of lighting and lighting technology, this course discusses LED technology and gallium nitride technology in particular:</p> <ul style="list-style-type: none"><li>• Physical principles of LEDs. Band gap engineering in LEDs.</li><li>• Semiconductor materials for optoelectronics</li><li>• Relationship between material properties and LED properties</li><li>• Manufacturing processes</li><li>• Efficiency considerations</li><li>• Front-end and back-end processing</li><li>• Application examples in general lighting, automotive technology, sensor technology</li><li>• Infrared LEDs, visible light, UV LEDs</li></ul> |                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                             |                   |                                                          |
| <p>After completing the module, students will have an overview of the current state of LED technology and the development opportunities that solid state lighting will offer in the future. In addition, they will have a basic understanding of the physical processes within LEDs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                             |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                             |                   |                                                          |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                             |                   |                                                          |

| The participants will be able to describe the origin of gravitational waves phenomenologically, name types of sources and assign typical spectra to them. The participants can name different types of detection of gravitational waves and describe their mode of action qualitatively. The participants can name essential components of an interferometric gravitational wave detector and explain how they work. The participants can name essential fundamental noise processes, explain their respective physical causes and assign frequency ranges in which they limit the sensitivity of gravitational wave detectors. The participants can name advanced interferometer techniques and quantum technologies for increasing sensitivity and explain their mechanisms of action. |                              |                   |                                                          |

| After completing the module 'Sensors for non-electrical quantities', students will have an overview of the use and dimensioning of electrical sensors for non-electrical quantities. The in-depth fundamentals enable the selection, use and error assessment of modern sensors. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary qualifications are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                          |                   |                                                                        |

| After completing the module 'Digital Measurement Data Processing with Microcomputers', students will have an overview of the functionality and programming of microcontrollers for measurement data processing. The acquired practical knowledge enables the programming of embedded systems for metrological applications. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary skills are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                          |                   |                                                                        |

| After completing the "Bioanalytics" module, students will have an overview of analytical procedures in molecular biology and biochemistry. The practical knowledge they have acquired enables them to carry out and interpret simple analyses. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary qualifications are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                        |                   |                                                                        |

| <p>After completing the "Biomedical Engineering" module, students will have an overview of the most important diagnostic procedures in human medicine. The practical knowledge acquired enables the design and evaluation of simple diagnostic procedures.</p> <p>In accordance with the didactic concept of the course, the knowledge acquired in the lecture is put into practice in laboratory experiments after an introductory colloquium in teamwork. Students will also practise scientific writing and documentation in an experimental protocol.</p>                                                                  |                                                                                         |                   |                                                                        |

| After completing the module 'Nanoelectronics', students will have an overview of the fundamentals of quantum mechanics and its application to metallic, magnetic and superconducting components with nanometre dimensions.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                   |                   |                                                                        |

| After completing the 'Precision Metrology' module, students will have an overview of the fundamentals of precision metrology and primary standards at PTB and metrology in Germany. Through a field trip to the PTB, students learn about the structure of primary standards and the dissemination of SI units. The students are able to apply this knowledge in the analysis and design of measurement and sensor systems.                                                                                                                                                                                      |                                                                                          |                   |                                                                        |

| After completing the module, students will have an overview of the fundamentals of quality management and process optimisation. Thanks to the practical knowledge acquired, students will be able to solve simple optimisation tasks using statistical design of experiments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                             |                   |                                                                        |

| After completing the module “Fundamentals of Medicine for Engineers”, students have a basic overview of human physiology and the use of medical diagnostic procedures. These basics enable them to understand medical diagnostic procedures.                                                                                                                                                                                                                                                                                                                        |                                  |                   |                                                                        |

| After completing the module 'Measurement Electronics with Practice', students will have an overview of the circuit technology and measurement methods of measurement electronics. The practical knowledge they have acquired enables them to set up circuits for measurement applications. In-depth practical experience with measurement methods that are dealt with in the measurement electronics lecture is taught in the laboratory. In accordance with the didactic concept of the course and the design of the individual components.                                                                                                                                                                                                                                                                                                                          |                                                                                   |                   |                                                                        |

interdisciplinary skills are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation

| <p>Printing Processes<br/>Design with CAD<br/>Slicer<br/>G-Code<br/>Print parameters<br/>Printer electronics and sensors<br/>Printing materials<br/>Printing errors<br/>Post-treatment<br/>Applications</p> <p>After an introduction to computer-aided design (CAD) and introductions to the 3D printers available at the institute, project work is handed out in the tutorial. As part of this project work, students design components for a given task and then produce them on the 3D printers available at the institute. The results are presented by the group at the end of the exercise as part of a presentation.<br/>presented by the group.</p> |                                              |                   |                                                                        |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |                   |                                                                        |
| <p>After completing the module, students will have an overview of the most important additive manufacturing processes. They know the most important components of various printing systems, have mastered the basics of programming these systems and have an overview of usable materials. On completion of the exercise, they will have mastered the basics of design using computer-aided design (CAD) so that they can design components that are produced on the printers available at the institute. They are able to select a suitable printing process for a problem, generate print data and assess the print results.</p>                          |                                              |                   |                                                                        |

| After completing this module, students have basic knowledge of architectures and protocol standards of data bus systems in modern motor vehicles as well as industrial plants. They are familiar with functional principles and properties of commonly used data buses from various application areas. The fundamentals learned enable them to independently design or analyze and evaluate networked systems.                            |                                                                                              |                   |                                                          |

| Fundamentals and application of nonlinear control theory, Lyapunov stability theory, exact linearization, Sliding mode control, method of the description function for non-linear systems (harmonic linearization)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                       |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                       |                   |                                                          |
| <p>After completing the module, students will be able to describe non-linear systems in the form of differential equations.</p> <p>With the help of Lyapunov's stability theory, students are able to describe the rest positions of non-linear systems and assess their stability.</p> <p>The learned method of exact linearization enables students to apply known methods of linear controller design to non-linear systems with affine input. Exact linearization compensates for the non-linearities present in the system using a nonlinearities present in the system by means of a feedback law and thus allows the design of a linear controller.</p> <p>Using the method of sliding-mode control, students are enabled to design switching controllers based on state-dependent switching between different control laws and to evaluate them with regard to the limit cycles that occur.</p> <p>limit cycles.</p> <p>In addition, using the harmonic balance method, students acquire the ability to analyze oscillations and limit cycles in non-linear systems and to make statements as to whether these oscillations will actually occur.</p> |                                                                                       |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                       |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                           |                   |                                                          |
| Students will be familiar with the functionality of modern laser systems used in the field of semiconductor technology and can explain their mode of operation based on theoretical models. They can describe the interaction of laser light with matter theoretically. They analyze optical emission spectra (luminescence, plasma, Raman scattering, time-resolved signals) and can draw conclusions about material and interaction processes. They know the basic processes of laser material processing, especially with modern ultrashort pulse lasers. They can describe nonlinear optical processes theoretically and understand their significance for laser-based methods in semiconductor technology. They record optical spectra from laser-based processes under guidance and independently prepare a scientific evaluation and interpretation, which they present in a short presentation. |                                                                                           |                   |                                                          |

| Descriptive and comparative statistics, significance tests, outlier tests, application of important probability distributions (normal distribution, Student's t-distribution, F distribution). Fundamentals of design of experiments and analysis, statistical analysis of obtained factors and models. Introduction to the matrix version of least squares. System optimization with respect to simple and multiple targets. For all modules (I # III): use of free (for academic purposes) state-of-the-art statistical software R and associated integrated programming environment RStudio.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                 |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                 |                   |                                                          |
| Overarching target is to familiarize participants with statistical principles of data analysis, comparison of and inference from experimental data (part I - Statistics), the optimal design of experiments (part II - Design of Experiments), and system optimization (part III - Optimization). Participants will learn to use the state-of-the-art statistical software R and apply the content of the lecture to optimize multi-parameter problems typically encountered in an industrial setting. After attending the course participants will be able to analyze experimental data according to established statistical procedures (test for outliers, confidence intervals for a single response and differences between observations of pairs of responses, evaluation and planning of sample sizes). Part II # Design of Experiments # enables the participants to plan experiments for maximal efficiency and analyze the reliability of the parameters extracted from the data (determination and understanding of the relevance of process variances, confidence intervals and significance of extracted process parameters). Participants furthermore will be skilled in using least-squares methods applied to data analysis and model building. During part III # Optimization # participants will learn to optimize multidimensional systems which include interaction between the controlling factors and multiple, possibly conflicting targets. |                                                 |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                 |                   |                                                          |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able assess the EMC product safety by failure mechanisms.    |                                             |                   |                                                               |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able to assess the EMC product safety by failure mechanisms. The students are able to investigate current EMC issues autonomously, structure and present them to an audience. |                                                                   |                   |                                                               |

| After completing this module, students will have basic knowledge on the tools of digital signal processing in the time and frequency domain and can apply these tools to corresponding problems.                                                                                                                                                                                                                                                                    |                                                      |                   |                                                          |

| The lecture deals with the basics of modern communication measurement technology. Students will learn about the measurement of signals and transmission characteristics in the time and frequency domain, antenna measurement technology, protocol measurement technology and channel measurement, which are essential for understanding and using state-of-the-art measuring devices, for example in the field of mobile communications. After completing the module, students will be able to use current measurement systems in research and development independently. |                                  |                   |                                                                                                  |

| Students have basic knowledge of modern computer architectures and an understanding of the function of modern computers. With the knowledge they have acquired, they are able to configure computer systems on a component basis and evaluate their performance.                                |                                                      |                   |                                                          |

| After completing the module, students will have an overview of the current state of LED technology and the development opportunities that solid state lighting will offer in the future. In addition, they will have a basic understanding of the physical processes within LEDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                             |                   |                                                          |

#### Contents

With a focus on optical and electrical characterisation methods, procedures for the investigation of materials and devices from the field of semiconductor technology are presented:

1. optical spectroscopy and microscopy methods
  1. absorption spectroscopy
  2. fluorescence spectroscopy
  3. time-resolved spectroscopy
  4. IR spectroscopy
  5. Raman spectroscopy and microscopy
  6. photon correlation spectroscopy
2. scanning electron microscopy
3. x-ray diffraction
4. atomic force microscopy
5. electrical measurement techniques
  1. IV
  2. CV
  3. hall effect measurements
  4. Electrical measurement methods in the atomic force microscope

The methods are each explained on the basis of application fields with typical material systems, whereby silicon, III-V/II-VI semiconductors, group III nitrides and common substrate materials (SiC, sapphire) are discussed.

#### Objective qualification

Students are familiar with important optical, electrical and other characterisation methods used in the field of semiconductor technology. They will be able to select suitable methods for specific materials and components and explain and evaluate the information that can be obtained in each case. They will be able to describe the fundamental processes in the material in the respective measurement methods using technical terminology and will be able to plot, analyse and discuss individual measurement results provided.

| After completing the module ‘Sensors for non-electrical quantities’, students will have an overview of the use and dimensioning of electrical sensors for non-electrical quantities. The in-depth fundamentals enable the selection, use and error assessment of modern sensors. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary qualifications are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                          |                   |                                                                        |

| After completing this module, students will have basic knowledge of driver assistance systems and automated vehicles. They are familiar with the current state of the art in driver assistance systems and automated driving functions and know about the function-determining factors. The students are able to independently plan customer-value driver assistance systems and systems for vehicle automation. |                                                      |                   |                                                          |

| Upon completion of this module, students gain fundamental knowledge about methods and algorithms for classification of data. They are capable to select the appropriate means for real-world problems, to design a solution and to evaluate it.                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                           |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                           |                   |                                                          |

| After completing the module ‘Sensors for non-electrical quantities’, students will have an overview of the use and dimensioning of electrical sensors for non-electrical quantities. The in-depth fundamentals enable the selection, use and error assessment of modern sensors. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary qualifications are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                          |                   |                                                                        |

| After completing the 'Precision Metrology' module, students will have an overview of the fundamentals of precision metrology and primary standards at PTB and metrology in Germany. Through a field trip to the PTB, students learn about the structure of primary standards and the dissemination of SI units. The students are able to apply this knowledge in the analysis and design of measurement and sensor systems.                                                                                                                                                                                      |                                                                                          |                   |                                                                        |

| After completing the module, students will have an overview of the fundamentals of quality management and process optimisation. Thanks to the practical knowledge acquired, students will be able to solve simple optimisation tasks using statistical design of experiments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                             |                   |                                                                        |

| After completing the module 'Digital Measurement Data Processing with Microcomputers', students will have an overview of the functionality and programming of microcontrollers for measurement data processing. The acquired practical knowledge enables the programming of embedded systems for metrological applications. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary skills are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                                                          |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                    |                   |                           |
| After having completed the module automation engineering, students are able to reproduce and explain extensive basic and methodological knowledge of automation systems as well as their components (process computer, actuators, sensors, HMI). First of all, this contains that the students can explain the classification, the control and the coupling of technical processes exemplarily. They are also able to analyze information in technical processes and in signals, including signal detection and signal conversion, based on simple case examples. In addition, the students can describe basic computer structures in automation technology as well as the basics of the representation and processing of information in process computer systems in principle. Therefore, they can explain the mechanisms of process control for real-time capability and the task concept of operating systems exemplarily. They are also able to fundamentally categorize organizational, distribution and communication structures of automation systems based on simple case examples. In addition, students can reproduce basic knowledge concerning the means of description Petri Nets and are able to apply that means independently in order to model processes. |                                                                    |                   |                           |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                    |                   |                           |

| Optimal state control, Kalman filter, LQG, norms of signals and systems, internal stability, parameter uncertainty, coprime decomposition, Youla parameterization, minimization of the 2-/inf-norm, H2-/Hinf-optimal control, $\mu$ -synthesis, robust stability, CAD exercises with MATLAB                  |                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                      |                                             |                   |                                                          |
| Students are able to analyze and design controllers in the field of norm-optimal, robust control engineering. After completing the module, students will have an overview of modern methods for designing controllers for systems with pronounced uncertainties and are able to investigate their stability. |                                             |                   |                                                          |

| Upon completion of this module, students will have an overview of the complexity of the vehicle development process and about environment, requirements and boundary conditions for electronic systems in motor vehicles. In particular, they have acquired an understanding of the architectures of ECUs and sensors and basic sensor principles using the example of selected system functions in the field of drivetrain and chassis development.                                                                 |                                             |                   |                                                          |

| After completion of this module, the students will have advanced skills in writing scientific papers. Within the scope of the advanced seminar, changing current research topics from the field of electronic vehicle systems will be elaborated, deepened and scientifically processed. |                                          |                   |                                                          |

| After completing this module, students will have basic knowledge of numerical optimization methods and associated standard software libraries. They are also familiar with methods and the current state of the art for object tracking in the field of machine perception of automated vehicles. Students will be able to independently solve optimization problems for electronic vehicle systems and implement algorithms for object tracking with radar or lidar sensors. |                                               |                   |                                                          |

| Automotive industry is changing rapidly these days. Both electric drives and autonomous driving change the requirements on vehicles dramatically. These changes include innovative vehicle systems, vehicle concepts and many aspects of systems engineering. In this class, selected topics will be presented and discussed by both scientists and students. These topics include electric vehicles, autonomous driving, safety and security aspects, system architecture, development processes and other related fields. |                                                   |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                   |                   |                                                          |
| The students will study selected scientific topics in automotive systems engineering on an advanced level. They will be trained to present a scientific topic of their choice to a scientific audience. Adjacent to their presentation they have to defend their major theses in an extended discussion.                                                                                                                                                                                                                    |                                                   |                   |                                                          |

| After completing this module, students will have basic knowledge of driver assistance systems and automated vehicles. They are familiar with the current state of the art in driver assistance systems and automated driving functions and know about the function-determining factors. The students are able to independently plan customer-value driver assistance systems and systems for vehicle automation. |                                                      |                   |                                                          |

| <p>The contents result primarily from the qualification measures QM2b+3a of the German Legal Accident Insurance (DGUV) Information 200-005 for work on vehicles with high-voltage systems. Electrotechnical work in a voltage-free state on non-HV intrinsically safe systems level 2 according to DGUV Information 200-005" and working under voltage and near touchable live parts Level 3 according to DGUV Information 200-005".</p>                                                                                                                                                                                                                                        |                                                     |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                     |                   |                                                          |
| <p>After completing this module, the students have basic knowledge on HV safety resulting from the qualification measures QM2b+3a of DGUV Information 200-005 for work on vehicles with high-voltage systems. They achieved in particular, an understanding of the electrical hazards associated with the use of HV systems in vehicles. The students will understand and be able to apply appropriate processes guaranteeing safety and health in electrotechnical work under high voltage.</p> <p>The qualification is documented with the successful participation in the practical exercises as well as a proof of the acquired skills and knowledge by an examination.</p> |                                                     |                   |                                                          |

| <p>Compulsory attendance at the seminar:</p> <p>Participation in the seminar is required and recorded by attendance list and signature. It will be carried out short tests on the individual contents in the event.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                     |                   |                                                          |

The attendance as well as the tests in the seminar are mandatory so that the lecturer is able to assess the individual level of knowledge and training of the participants as well as their personal suitability before the students will perform experiments of their own.

Limitation of the number of participants:

The number of participants is limited to 20 people so that the required practical part is sufficiently can be mediated.

Additional note:

The practical exercises take place at the institute's training stands. Training contents include measurements of the output voltages on a frequency converter and the replacement of battery cells. These works will be performed under high voltage. If they are not carried out in accordance with the regulations and with the necessary knowledge, they are life threatening. It is therefore important to reduce the risk for students. The lecturer must therefore obtain an overview of the level of knowledge and training of the participants as well as their personal suitability in advance. This goal is achieved through compulsory attendance and tests in the seminar.

| After completing the module, students will be able to describe non-linear systems in the form of differential equations.<br>With the help of Lyapunov's stability theory, students are able to describe the rest positions of non-linear systems and assess their stability.<br>The learned method of exact linearization enables students to apply known methods of linear controller design to non-linear systems with affine input. Exact linearization compensates for the non-linearities present in the system using a nonlinearities present in the system by means of a feedback law and thus allows the design of a linear controller.<br>Using the method of sliding-mode control, students are enabled to design switching controllers based on state-dependent switching between different control laws and to evaluate them with regard to the limit cycles that occur.<br>limit cycles.<br>In addition, using the harmonic balance method, students acquire the ability to analyze oscillations and limit cycles in non-linear systems and to make statements as to whether these oscillations will actually occur. |                                                                                       |                   |                                                          |

| Students understand the models of DC and AC motor drives and the mathematical concept of space vectors and can utilise them in simulations. They know the control structures for the motor types DC motor, asynchronous machine and synchronous machine with and without speed sensor. They can design and analyse their own control structures and tune the control parameters. They understand sensors commonly used in drive systems like compensated current sensor, resolver, incremental angular sensor and the corresponding evaluation functions. They can use the principle of space vector modulation and similar modulation methods to design their own hardware and software. |                                                                                  |                   |                                                          |

| After completing the module, the students have in-depth knowledge of the function of rotating electric machines and the physical intervention options for speed control. The deepened fundamentals enable the design of simple drives taking into account possible fault conditions as well as the entry into the design of electrical machines.                                                                                                                                      |                                              |                   |                                                          |

| The module teaches a system-oriented approach to the design of electric drives in road vehicles by considering the vehicle as a mechatronic system. Starting from the basics of drive design (driving resistances, power transmission), common drive topologies of road vehicles are dealt with. Special features of the motors used with regard to their function and their properties as inverter-fed drives are dealt with. The knowledge gained here on the design and dimensioning of traction drives is then applied to road vehicles (electric and hybrid vehicles). |                                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                              |                   |                                                          |
| After completing the module, the students know the essential structures of conventional and new types of vehicle drives and the electrical machines and converters used in these vehicles. They are also able to carry out a simple design.                                                                                                                                                                                                                                                                                                                                 |                                              |                   |                                                          |

| After completing the module, students will have an in-depth understanding of electromagnetic theory for radiation fields as well as a basic understanding of wave propagation and related phenomena (e.g. Radar cross section). They have become familiar with different types of antenna elements as well as array antennas and have a clear and well-founded theoretical understanding of their electromagnetic properties and their parameters. The students have gained first experiences in the use of modern 3D-EM simulation tools and modern RF measurement techniques and are able to acquire further in-depth knowledge in the application of these tools on their own.                                                                            |                                                         |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                             |                   |                                                          |
| <p>The module provides an overview of radar systems and their signal processing. Different radar concepts (pulse, FMCW, ...), their associated hardware, and the most important key terms and concepts of signal processing are considered. Automotive radar systems are emphasized.</p> <p>After completion of the module the students will have in-depth knowledge of radar system concepts in connection with the associated circuit concepts and signal processing and will be able to evaluate and conceptually design radar systems on this basis. Students have knowledge of the most important algorithms used in radar signal processing and have gained experience in the function and interaction of radar hardware and software. This extends from signal generation and signal acquisition to signal evaluation (range and velocity determination) and angle determination with array antennas. This enables the students to work on detailed questions in radar system development and to acquire the associated special knowledge independently.</p> |                                                             |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                             |                   |                                                          |
| After completing the module, the students are able to use the acquired basic knowledge of current cryptology to design basic crypto systems and assess their level of security.<br>The students have acquired the ability, by means of the common techniques of protocols and standards of network security, to analyse fundamental features of a security design in current network environments, and apply basic design methods of network security.                                  |                                             |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                      |                   |                                                          |
| The students have basic knowledge of modern computer architectures and an understanding of the function of modern computers. With the knowledge they have acquired, they are able to configure computer systems on a component basis and evaluate their performance.<br>In the Lab course, students will be able to design simple circuits and embedded software and evaluate the result in terms of its logical and temporal behaviour by means of measurements or simulation. They will be able to formulate and implement a hardware design in a design language and gain an overview of the phases of a complex hardware design. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary skills are taught and practised. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                                      |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                     |                   |                                                          |
| - Students have detailed knowledge of modern computer architectures and an advanced understanding of the function of modern computers. With the knowledge they have acquired, they are able to configure complex computer systems on a component basis and evaluate their performance in detail.<br>In the Embedded Processors internship, students learn about the areas of application and potential uses of Application Specific Instruction Set Processors (ASIPs). They are then able to break down larger tasks into sub-problems and solve them in teamwork. They will have mastered the competent use of complex tools and design processes for hardware and software design. In accordance with the didactic concept of the course and the design of the individual components, interdisciplinary skills are taught and practiced. In the context of papers, colloquia and final presentations, these include scientific writing and documentation, dialogue and presentation techniques as well as teamwork in the laboratory or project. |                                     |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                     |                   |                                                          |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                     |                   |                                                          |

| The lecture gives a broad introduction to network security, including foundations of cryptography, message integrity, authentication, privacy and anonymity, application layer security, secure network protocols, security in the physical layer, as well as broader aspects security aspects related to reliability and safety. It also discusses relevant topics in various application domains, such as (i) security in next generation mobile networks, (ii) satellite network security; (iii) security in the compute continuum of IoT, edge and cloud computing; (v) security functions within the network management; (vi) physical layer security in optical and wireless networks. |                                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |                   |                                                          |
| On finishing this module the students have a survey of the theoretical principles of cryptography. They are able to analyze basic cryptographic systems and are able to design basic electronic security systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                              |                   |                                                          |

| <p>The students will develop an understanding of the fundamental concepts of real-time embedded operating systems (RTOS) and their most relevant requirements (e.g. temporal predictability and reliability). The students will acquire in-depth knowledge about different design choices associated to RTOS that are currently relevant in the academic and the industrial domain. Moreover, the students will be able to critically reason about the trade-offs associated to the aforementioned design choices, and will be able to identify the conditions under which they could be used for the development of safety-critical applications. Through individual and group work of practical nature the students will learn how to develop and implement certain aspects of RTOS. Moreover the students will acquire a set of skills essential for scientific research and publishing, such as the abilities to present and critically review scientific publications.</p> |                                                                       |                   |                                                          |

| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able assess the EMC product safety by failure mechanisms.    |                                             |                   |                                                               |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                   |                   |                                                               |
| The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able to assess the EMC product safety by failure mechanisms. The students are able to investigate current EMC issues autonomously, structure and present them to an audience. |                                                                   |                   |                                                               |

| <p>All modern mobile communications applications (e.g., GSM, WLAN, GPS, Bluetooth, DECT, etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated into low-cost CMOS technology, resulting in significant differences from the classic design of high-frequency circuits based on discrete components. The lecture provides an introduction to the design of analog, integrated CMOS mobile communications receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>• High-frequency amplifier circuits</li><li>• Simulation of electronic noise</li><li>• Low-noise input amplifiers in CMOS</li><li>• Mixer circuits</li><li>• HPhase-locked loops (PLLs)</li><li>• Voltage-controlled oscillators</li></ul>                                                                                                                                                                                                                        |                                     |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                     |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p> <p>They will acquire fundamental knowledge in the use of the Spectre-RF design tool, which is widely used in industry for the design of analog integrated circuits.</p> <p>In accordance with the didactic concept of the course and the structure of the individual components, interdisciplinary skills are taught and practiced. These include scientific writing and documentation, conversation</p> |                                     |                   |                                                          |

and presentation techniques, and teamwork in the laboratory or on projects, which are covered in assignments, colloquia, and final presentations.

| <p>All modern mobile radio applications (e.g. GSM, WLAN, GPS, Bluetooth, Dect. etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated in low-cost CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture gives an introduction to the design of analog, integrated CMOS mobile radio receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>- High frequency amplifier circuits</li><li>- Simulation of electronic noise</li><li>- Low-noise input amplifiers in CMOS</li><li>- Mixer circuits</li><li>- Phase-locked loops (PLLs)</li><li>- Voltage-controlled oscillators</li></ul> |                            |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                            |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                            |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                            |                   |                                                          |

A free one-day excursion to Alstom Transport Deutschland in Salzgitter and to another destination is also offered.

### Objective qualification

After completing the module, students will be able to understand electrical railway systems with regard to the functioning of their components and to evaluate their properties.

| After completing the module, students will possess advanced skills in writing a scientific paper. In the course of the advanced seminar, current research topics from the area of machine learning are discussed, deepened, and scientifically prepared. The participants will read scientific publications, present them and discuss them jointly. The structure of a scientific conference publication will be covered as well as strategies for the writing of the standard sections of a paper.<br>This course has a discursive character, therefore regular attendance of the participants is required. |                                     |                   |                                                          |

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                       |                   |                                                          |
| After successful completion of the module, students will be able to classify time series (e.g., speech signals) using hidden Markov modeling. The students acquire all the necessary knowledge to suitably select, design, and evaluate methods and algorithms for automatic speech recognition to solve problems in practice.                                                                                                                                                                                                                                                                                                            |                                                                                       |                   |                                                          |

| This module from the master's program is also suitable for bachelor students. Basic knowledge of digital signal processing, as e.g. acquired in the module #digital signal processing#, facilitates the understanding of this lecture.                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                       |                   |                                                          |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |            |                  |                 |

| Upon completion of this module, students gain fundamental knowledge about methods and algorithms for classification of data. They are capable to select the appropriate means for real-world problems, to design a solution and to evaluate it.                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                           |                   |                                                          |
