| After completing this module, students will have basic knowledge of typical sources and sinks of electromagnetic interference in motor vehicles and will be familiar with the principles of coupling mechanisms of interference in the electrical system of a motor vehicle. The basics they have learned enable them to independently select basic EMC protection measures, analyse and evaluate their effectiveness and select and apply common procedures for testing EMC.                                                                                                                                                |                                                     |                   |                                                          |

| Students are able to apply a uniform approach to mathematically description of the dynamics of mechanical (multi-body) systems, electrical networks and mechatronic (electromechanical) systems. The use of different types of constraints can also be analysed and evaluated with regard to their solution behaviour. They can formulate and analyze equations of motion of selected mechatronic systems. They are thus able to independently develop and evaluate problem-adapted models for mechatronic problems. |                                            |                   |                                  |

| On completion of this module, students will have deepened their knowledge from the course 'Computer Networks 1'. They will be familiar with the processes used on the Internet and the procedures involved.                                                                                   |                                                                                       |                   |                                                 |

| Relying on the fundamental concepts of the course “Robotics1”, the course “Robotics2” offers a focus on more practical issues arising in the control if robotic systems. This includes in particular:<br>- Principles of perception and measurments and robot sensing<br>- Techniques of modeling and simulation<br>- Paradigms and best practices of robot programming<br>- Specification of robotic tasks<br>- Planning method of robotic actions<br>- Techniques for the study of work space and singularities<br>- Distinction of rigid and elastic components<br>- Advances techniques for controlling robotic systems<br>- Combinatorial modeling of mechanical systems                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                      |                   |                              |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                      |                   |                              |
| The course conveys basic computer science paradigms, concepts, algorithms of robotics to the students. After a successful completion of the course, the acquired knowledge offers a solid foundation that enables the students to realize advanced robot applications in diverse technological fields. In particular, the students gain following competences:<br>- Deepened understanding of essential, theoretical foundations of robotics<br>- Broadened knowledge of practical tasks for running robots<br>- Further pervasion of a systemic, model-based approach to robotics<br>- Perception of a robot as a technical system for motion and force generation<br>- Deepened comprehension of properties of spatial motions<br>- Expansion of programming competences<br>- Increased ability to reflect on programming activities<br>- Qualification for evaluation of computational and geometrical tasks in robotics as well as of algorithms for solving them |                                                                                                                                                                                                                      |                   |                              |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                      |                   |                              |

| With successful completion of the module, the students possess knowledge of the technical and mathematical foundations in robotics. They have the basic knowledge to enter advanced studies and are able to apply their knowledge for the analysis and realization of simple robotic applications                                                                                                           |                                                                                                                                                                                                                |                   |                              |

| Students have basic knowledge of modern computer architectures and an understanding of the function of modern computers. With the knowledge they have acquired, they are able to configure computer systems on a component basis and evaluate their performance.                                |                                                      |                   |                                                          |

| <p>Data converters bridge digital virtual space and analog real world in cyber physical system (CPS), and become key building circuit blocks. This lecture deals with the circuit design of CMOS data converters. In particular, circuit techniques related to low-power and high-resolution ADCs, which are important for sensor signal detection in IoT application, will be explained. It is assumed that the students have basic knowledge of CMOS integrated circuit design and signal processing such as Laplace transform and Z transform.</p> <p>General introduction of data converters</p> <p>1. Data converter application areas</p> <p>Sensor interface, Communication (wireless/wireline)</p> <p>2. Basic theory in data conversion</p> <p>Sampling/Quantization, Performance metric (INL/DNL, SNDR, SFDR, ENOB, FoM)</p> <p>3. Architectures and features of data converters</p> <p>2-1. High resolution data converter (SAR, ##, VCO based)</p> <p>2-2. High speed data converter (Flash, Pipeline)</p> <p>Implementation of low-power and high-resolution CMOS integrated ADCs</p> <p>4. Building blocks of ADC</p> <p>Comparator, operational amplifier</p> <p>5. SAR-ADC with charge redistribution.</p> <p>3-1. Power reduction techniques</p> <p>3-2. Resolution enhancement techniques (digital calibration etc.)</p> <p>6. High resolution ## modulator</p> <p>7. Time based (VCO based) ADC</p> <p>8. Hybrid-ADC</p> <p>9. Characterization of data converters</p> |                                              |                   |                                                          |

| <ul style="list-style-type: none"><li>• An embedded system is some combination of computer hardware and software, either fixed in capability or programmable, that is designed for a specific function or for specific functions within a larger system. For example, they are part of industrial machines, agricultural and process industry devices, automobiles, medical equipment, cameras, household appliances, airplanes, sensor networks, internet-of-things, as well as mobile devices.</li><li>• The focus of this lecture is on the design of low-power embedded systems using formal models and utilizing the latest micro-architectural features for improved performance and energy efficiency, with practical examples using C/C++.</li></ul> |                                        |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                        |                   |                                                          |
| The students <ul style="list-style-type: none"><li>• gain an understanding of specific requirements, issues, and performance evaluations of low-power embedded system applications.</li><li>• make design decisions with deep knowledge of the inherent cost-versus-performance trade-offs in low-power, resource-constrained systems.</li><li>• apply the principles of real-time operating systems and scheduling theory to design efficient applications with shared resources.</li><li>• analyze different architectures, evaluate their hardware-software interface and memory architecture and different optimization techniques for microcontrollers, such as DSP extensions to the instruction set architecture.</li></ul>                           |                                        |                   |                                                          |

| The students know the basic design of complex electronic systems at high level of abstractions. This includes the optimized partitioning, scheduling and evaluation of mixed hardware and software design solutions dedicated to embedded systems. The students understand about advanced related topics in HW/SW codesign and performance analysis for safety critical and real-time embedded systems. Starting from simple system specification the students can use tools for partitioning, optimization and performance analysis to synthesize the hardware/software system. |                                                                                                                                                                                          |                   |                                                          |

| The students will get basic knowledge in the platforms used in autonomous systems as well as very recent fields required to the design of safe autonomous systems considering functional and non-functional aspects (e.g. safety, reliability). The students learn to implement simple autonomous systems tasks (Sensor fusion and AI computation which pose special demands on the architectures in order to implement the Perceive - Decide - Act loop) on embedded platforms. The students can balance the performance limitations of the platform against the complexity of tasks and therefore find an optimal utilization of the resources.                                                        |                                                                                                                                                                                         |                   |                                                          |

| After having successfully completed the lecture Automation Engineering, the students will have a sound basic knowledge of term and methods within the area of automation engineering and are able to reproduce, describe and apply the latter. The students can explain modeling, classification, control and coupling of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                         |

technical processes. They are also able to analyze information handling in technical processes and information transfer. Students are capable to determine the organizational, distribution and communication structures of automation systems. In addition, the students can describe basic aspects of modularization, standardization, and automation. The students understand the digitization topics industrial internet, cloud and cyber-physical systems. As such, the students can reproduce the approaches of knowledge management, industrial big data, and decision support. The laboratory enables students to independently apply the acquired skills to simple, practical tasks in various automation domains.

| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                             |                   |                                                          |
| After completing the module, students will have an overview of the current state of LED technology and the development opportunities that solid state lighting will offer in the future. In addition, they will have a basic understanding of the physical processes within LEDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                             |                   |                                                          |

| Students are able to explain the structure, functionality, and application of foundation models (large, generally pre-trained AI models) and describe their core components such as tokenization, embeddings, transformer architectures, and training procedures. They can apply methods such as prompt engineering, retrieval-augmented generation, finetuning, and agent systems to adapt AI models to specific tasks. Furthermore, they are able to analyze technical concepts, select appropriate tools, and design and evaluate AI applications while considering legal and ethical frameworks. In the accompanying lab sessions, students implement and experiment with the presented methods in practice, thereby deepening their understanding through hands-on experience. |                                                                                                                                                                                     |                   |                                                          |

| Die Studierenden lernen Techniken zur Verifikation, Validierung und dem Testen von ASIC-Designs kennen. Auf Basis von praktischen Beispielen und aktuellen Entwicklungswerkzeugen werden die Studierenden an Herausforderungen der heutigen Chipentwicklung und dem Testen herangeführt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                      |                   |                                      |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                      |                   |                                      |

| This course focusses on the main challenges for the design of modern semiconductor storage systems under the aspect of rapidly growing data storage requirements. Current, volatile and non-volatile memory types will be covered from the fundamental semiconductor technology level up to higher levels of system-level abstraction, with a focus on reliability and protection of stored data. Furthermore, Processing-in-Memory Architectures (PIM) based on conventional and 3D-stacked memories are analyzed, taking into account aspects such as low latency and energy consumption. |                                                                                                             |                   |                               |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                             |                   |                               |

| After completing the module, the students know how to design and optimize complex circuits on modern FPGA devices. Moreover, they are capable to efficiently use all the embedded dedicated hardware modules, e.g., DSPs, different embedded memories, I/O high speed interfaces, or analog-to-digital converters. This course makes emphasis on the design of high performance circuits by understanding the FPGA architecture limitations and including dynamic and partial reconfiguration mechanisms. The students will be introduced to emerging reconfigurable logic devices and their use in demanding technical applications. |                                                                                                                                              |                   |                               |

| <p>This module covers fundamental concepts, methods, and applications of human-robot interaction. Topics include:</p> <ul style="list-style-type: none"><li>• Fundamentals and definitions of human-robot interaction</li><li>• Application fields: industrial, service, healthcare, and social robotics</li><li>• Safety in collaborative robotic systems and relevant standards (ISO 10218, ISO/TS 15066)</li><li>• Physical interaction: haptic feedback, force and impedance control</li><li>• Social robots: non-verbal communication, gestures, and facial expressions</li><li>• Speech-based and multimodal interaction</li><li>• User-centered design and usability evaluation</li><li>• Trust, acceptance, and situational awareness</li><li>• Ethical, legal, and societal aspects of HRI</li><li>• Current research directions and application scenarios</li></ul>                                                                                                                                                                                                                                                                                               |                                                                                                                                                            |                   |                                |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                            |                   |                                |
| <p>Upon successful completion of this module, students will have foundational knowledge of the design, evaluation, and safe implementation of human-robot interaction systems. Students will be able to develop interaction concepts for real-world application scenarios and evaluate them with respect to technical, ergonomic, and ethical criteria.</p> <p>They are able to</p> <ul style="list-style-type: none"><li>• Identify and classify fundamental concepts, paradigms, and application fields of human-robot interaction</li><li>• Explain and apply safety requirements and relevant standards (including ISO 10218, ISO/TS 15066) for collaborative robotic systems</li><li>• Describe and compare methods of physical and social interaction between humans and robots</li><li>• Design user-centered interfaces and interaction concepts and evaluate them with respect to usability</li><li>• Analyze factors such as trust, acceptance, and situational awareness in HRI systems and incorporate them into system development</li><li>• Reflect on and evaluate the ethical and societal implications of deploying robots in human environments</li></ul> |                                                                                                                                                            |                   |                                |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                            |                   |                                |

| <p>All modern mobile radio applications (e.g. GSM, WLAN, GPS, Bluetooth, Dect. etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated in low-cost CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture gives an introduction to the design of analog, integrated CMOS mobile radio receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>- High frequency amplifier circuits</li><li>- Simulation of electronic noise</li><li>- Low-noise input amplifiers in CMOS</li><li>- Mixer circuits</li><li>- Phase-locked loops (PLLs)</li><li>- Voltage-controlled oscillators</li></ul> |                            |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                            |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                            |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                            |                   |                                                          |
| Thomas H. Lee " The Design of CMOS Radio-Frequency Integrated Circuits" Cambridge University Press                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                            |                   |                                                          |

| All modern mobile communications applications (e.g. 5G, 6G, etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are integrated into the inexpensive CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture provides an introduction to the design of analog, integrated CMOS mobile radio receiver circuits. The lecture is divided into the following chapters: • High-frequency amplifier circuits • Electronic noise • Low-noise amplifiers in CMOS • Mixer circuits • Voltage-controlled oscillators • Power amplifiers                                                                                                                                                                    |                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                             |                   |                                                          |
| After completing the module, students will have acquired knowledge of analog receive and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for cellular applications (e.g. radio frequency amplifier circuits, electronic noise simulation). You have a basic knowledge of using the Specter-RF design tool, which is widely used in the industry for analog integrated circuit design. In accordance with the didactic concept of the event and the design of the individual components, interdisciplinary qualifications are taught or practiced. In the context of elaborations, colloquia and final presentations, these include scientific writing and documentation, conversation management and presentation techniques as well as teamwork in the laboratory or project. |                                             |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                             |                   |                                                          |

#### Contents

With a focus on optical and electrical characterisation methods, procedures for the investigation of materials and devices from the field of semiconductor technology are presented:

1. optical spectroscopy and microscopy methods
  1. absorption spectroscopy
  2. fluorescence spectroscopy
  3. time-resolved spectroscopy
  4. IR spectroscopy
  5. Raman spectroscopy and microscopy
  6. photon correlation spectroscopy
2. scanning electron microscopy
3. x-ray diffraction
4. atomic force microscopy
5. electrical measurement techniques
  1. IV
  2. CV
  3. hall effect measurements
  4. Electrical measurement methods in the atomic force microscope

The methods are each explained on the basis of application fields with typical material systems, whereby silicon, III-V/II-VI semiconductors, group III nitrides and common substrate materials (SiC, sapphire) are discussed.

#### Objective qualification

Students are familiar with important optical, electrical and other characterisation methods used in the field of semiconductor technology. They will be able to select suitable methods for specific materials and components and explain and evaluate the information that can be obtained in each case. They will be able to describe the fundamental processes in the material in the respective measurement methods using technical terminology and will be able to plot, analyse and discuss individual measurement results provided.

| Upon completion of the module, students will have a solid overview of advanced methods for analyzing electrical networks. They will possess in-depth knowledge of the mathematical description and modeling of complex networks using the Laplace transform, Kirchhoff's laws, and Modified Nodal Analysis (MNA). Students will be familiar with key concepts such as Tellegen's theorem, Foster synthesis, periodic structures, and fundamental network synthesis methods. They will be able to select and apply appropriate analysis techniques and systematically evaluate networks in terms of their behavior. |                                             |                   |                                                          |

| After completing the module, students will have an overview of the current state of LED technology and the development opportunities that solid state lighting will offer in the future. In addition, they will have a basic understanding of the physical processes within LEDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                             |                   |                                                          |

| Upon completion of this module, the students will acquire knowledge about integrated circuits for various biomedical applications and obtain a deep understanding about circuit techniques for design of analog integrated circuits for biomedical applications (e.g. HF-oscillators for glucose sensing).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                 |                   |                                                          |

| After completing the module, the students know how to design and optimize complex circuits on modern FPGA devices. Moreover, they are capable to efficiently use all the embedded dedicated hardware modules, e.g., DSPs, different embedded memories, I/O high speed interfaces, or analog-to-digital converters. This course makes emphasis on the design of high performance circuits by understanding the FPGA architecture limitations and including dynamic and partial reconfiguration mechanisms. The students will be introduced to emerging reconfigurable logic devices and their use in demanding technical applications. |                                                                                                                                              |                   |                               |

| All modern mobile communications applications (e.g. 5G, 6G, etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are integrated into the inexpensive CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture provides an introduction to the design of analog, integrated CMOS mobile radio receiver circuits. The lecture is divided into the following chapters: • High-frequency amplifier circuits • Electronic noise • Low-noise amplifiers in CMOS • Mixer circuits • Voltage-controlled oscillators • Power amplifiers                                                                                                                                                                    |                                             |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                             |                   |                                                          |
| After completing the module, students will have acquired knowledge of analog receive and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for cellular applications (e.g. radio frequency amplifier circuits, electronic noise simulation). You have a basic knowledge of using the Specter-RF design tool, which is widely used in the industry for analog integrated circuit design. In accordance with the didactic concept of the event and the design of the individual components, interdisciplinary qualifications are taught or practiced. In the context of elaborations, colloquia and final presentations, these include scientific writing and documentation, conversation management and presentation techniques as well as teamwork in the laboratory or project. |                                             |                   |                                                          |

| <p>All modern mobile radio applications (e.g. GSM, WLAN, GPS, Bluetooth, Dect. etc.) use analog receiver and transmitter circuits that are composed of a few elementary circuit blocks. For cost reasons, these are increasingly being integrated in low-cost CMOS technology, which results in significant differences to the classic design of high-frequency circuits based on discrete components. The lecture gives an introduction to the design of analog, integrated CMOS mobile radio receiver circuits.</p> <p>The lecture is divided into the following chapters:</p> <ul style="list-style-type: none"><li>- High frequency amplifier circuits</li><li>- Simulation of electronic noise</li><li>- Low-noise input amplifiers in CMOS</li><li>- Mixer circuits</li><li>- Phase-locked loops (PLLs)</li><li>- Voltage-controlled oscillators</li></ul> |                            |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                            |                   |                                                          |
| <p>After completing the module, students will have acquired knowledge of analog receiver and transmitter circuits in CMOS technology and have an advanced understanding of the design and function of modern analog integrated circuits for mobile radio applications (e.g. high-frequency amplifier circuits and simulation of electronic noise).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                            |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                            |                   |                                                          |
| Thomas H. Lee " The Design of CMOS Radio-Frequency Integrated Circuits" Cambridge University Press                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                            |                   |                                                          |

#### Contents

With a focus on optical and electrical characterisation methods, procedures for the investigation of materials and devices from the field of semiconductor technology are presented:

1. optical spectroscopy and microscopy methods
  1. absorption spectroscopy
  2. fluorescence spectroscopy
  3. time-resolved spectroscopy
  4. IR spectroscopy
  5. Raman spectroscopy and microscopy
  6. photon correlation spectroscopy
2. scanning electron microscopy
3. x-ray diffraction
4. atomic force microscopy
5. electrical measurement techniques
  1. IV
  2. CV
  3. hall effect measurements
  4. Electrical measurement methods in the atomic force microscope

The methods are each explained on the basis of application fields with typical material systems, whereby silicon, III-V/II-VI semiconductors, group III nitrides and common substrate materials (SiC, sapphire) are discussed.

#### Objective qualification

Students are familiar with important optical, electrical and other characterisation methods used in the field of semiconductor technology. They will be able to select suitable methods for specific materials and components and explain and evaluate the information that can be obtained in each case. They will be able to describe the fundamental processes in the material in the respective measurement methods using technical terminology and will be able to plot, analyse and discuss individual measurement results provided.

| After completing the module, students will acquire knowledge of legal requirements regarding electromagnetic compatibility. They will learn the structure, function, application and design of passive and active filter circuits. An important aspect here is to obtain a mains current that is as sinusoidal as possible in phase with the mains voltage with the help of so-called power factor correction (PFC). Students should understand how resonant power converters and quasi-resonant circuits work and how they are used, also by means of simulations. Finally, they should be able to understand the structure and function of multi-level converters. They will be able to conceptually design, dimension and analyse (also by simulation) corresponding assemblies. |                                              |                   |                                                          |

| Upon completion of the module, students will have an overview of modern digital logic circuits in CMOS technology, possess system-level knowledge, and have learned methods to design and analyze digital integrated circuits independently. Students will acquire knowledge of fundamental and advanced CMOS logic families and gain an in-depth understanding of timing behavior, layout principles, and optimization of digital circuits (e.g., clocked flip-flops, TSPC, C2MOS, and CML logic). They will be able to evaluate and improve circuit designs with respect to delay, power efficiency, and area consumption. |                                             |                   |                                                          |

| Upon completion of the module, students will have a solid overview of advanced methods for analyzing electrical networks. They will possess in-depth knowledge of the mathematical description and modeling of complex networks using the Laplace transform, Kirchhoff's laws, and Modified Nodal Analysis (MNA). Students will be familiar with key concepts such as Tellegen's theorem, Foster synthesis, periodic structures, and fundamental network synthesis methods. They will be able to select and apply appropriate analysis techniques and systematically evaluate networks in terms of their behavior. |                                             |                   |                                                          |

| After completing the module, students will have an overview of the current state of LED technology and the development opportunities that solid state lighting will offer in the future. In addition, they will have a basic understanding of the physical processes within LEDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                             |                   |                                                          |

| Upon completion of this module, the students will acquire knowledge about integrated circuits for various biomedical applications and obtain a deep understanding about circuit techniques for design of analog integrated circuits for biomedical applications (e.g. HF-oscillators for glucose sensing).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                 |                   |                                                          |

| <p>This course provides an in-depth exploration of mixed-signal integrated circuit design, with a primary focus on Analog-to-Digital Converters (ADCs) and Digital-to-Analog Converters (DACs)—the essential components that bridge the analog and digital worlds.</p> <p>Students will learn how to analyze, design, and evaluate the performance of data converters from both a system-level and circuit-level perspective. The course begins with a foundational overview of mixed-signal systems and key data converter performance metrics such as resolution, signal-to-noise ratio (SNR), and linearity. Following a review of circuit design fundamentals, lectures focus on the theoretical and practical principles of quantization, sampling, and noise in data converters. The course then systematically examines DAC architectures including binary-weighted, R-2R ladder, segmented, and current-steering types, with emphasis on speed, area, and matching trade-offs. Subsequent lectures discuss ADC architectures, covering flash, pipeline, successive approximation (SAR), and delta-sigma types. For each architecture, students will explore circuit implementation strategies, trade-offs in power and resolution, and real-world applications. Additionally, transistor-level implementation of the most commonly encountered sub-blocks such as comparators, reference circuits, opamps or frequency generation circuits will be discussed. The course culminates with a comprehensive look at simulation, verification, and test methodologies.</p> |                                                                                                                                                                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                              |                   |                                                          |
| <p>The students have knowledge of the architecture and fundamental operating principles of analog-to-digital converters and digital-to-analog converters. They understand and can assess key performance parameters such as resolution, signal-to-noise ratio, and linearity for various converter architectures. This enables them to identify the appropriate converter architecture for specific application areas (e.g., modern communication systems or biomedical sensors) and to design it at the circuit level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                              |                   |                                                          |

| <p>Neuromorphic computing is an approach which is inspired by the structure and function of human brains. Neuromorphic computers are based on Silicon devices which use physical artificial neurons and synapses to apply computations. In recent times, the term neuromorphic has been used to describe analog, digital, mixed-mode analog/digital VLSI, and software systems that implement models of neural systems. The implementation of neuromorphic computing on the hardware level can be realized by oxide-based resistive or ferro-electric memristors.</p> <p>The lecture presents the principles of biological computation and their implementation in hardware. Basic building blocks of neuromorphic technology are presented. The implications for the development of novel information processing technologies are outlined.</p> |                                      |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                      |                   |                                                          |
| After successfully completing the module, students will have understand the principles of biological computation. They will know how to implement them in hardware. They will have basic skills in applying neuromorphic engineering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                      |                   |                                                          |

| <p>Upon completion of the module, students will have a comprehensive understanding of the fundamentals and advanced concepts of phase-locked loops (PLLs) and frequency synthesis. They will be familiar with the systematic architecture of various PLL types, including analog and digital integer PLLs as well as fractional PLLs. Students will understand the causes and effects of jitter and phase noise, and will be able to evaluate and minimize them. They will be acquainted with specialized circuits such as Costas loops, delay locked loops (DLL), numerically controlled oscillators (NCOs), and software-based PLL implementations. The knowledge they acquire enables students to independently research related topics and apply theory to practice. This allows them to analyze and solve practical problems independently.</p> |                                             |                   |                                                          |

| This lecture deals with the design of digital circuits in CMOS technology. The students learn about alternative techniques for the realization of basic circuits as well as their manufacturing and design process. By using practical examples, various forms of implementation of integrated circuits are discussed and current challenges of today's chip development in modern semiconductor technologies are presented. After completing the module, students are able to independently design VLSI chips.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                  |                   |                               |

| <p>The Chip Design Laboratory is divided into three successive phases. All phases of the laboratory consist of interactive self-study and seminars. The latter provide students with the knowledge necessary to work on the tasks in small groups in self-study. During the independently organized work in the groups on a defined task (self-study), a research associate of the institute checks the progress and gives assistance if necessary. Phase 0: Chip conception and specification The hardware modules to be implemented in phase 1 are designed and specified in small groups during this phase. This phase is based on the target application to be executed on the hardware. The application as well as the hardware modules in form of a microcontroller, peripheral modules and co-processors are selected and all necessary features of these are summarized and documented in this phase. Phase 1: Module implementation and verification At the beginning of phase 1, the students implement individual hardware modules specified in phase 0, i.e., a microcontroller, peripheral modules and co-processors, in small groups using VHDL. The knowledge from previous courses, which is required for VHDL design and testbenches (with System-C), is refreshed and extended in two seminars. Phase 2: Chip design and prototyping After the module development, different groups perform: • functional verification and emulation using a FPGA evaluation board (in-circuit emulation), • performing a complete ASIC synthesis and back-end flow based on a library of standard cells, and • porting a small application onto the system...</p> |                                                                                                                                                                                                                                                                                                        |                   |                               |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                        |                   |                               |

In this laboratory, students design digital circuits using a RISC-V microcontroller with</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                        |                   |                               |

peripheral modules. During the different phases of the lab, the students design, specify, implement and verify digital circuits with hardware description languages, industrial EDA tools, System-C testbenches and hardware test setups. The qualification goals taught in this laboratory are successful project work in the field of digital circuit design from the specification to the in-circuit test of the designed circuit. The students gain knowledge about project planning, development work and teamwork. At the same time, students acquire specialized knowledge in their own work with used tools and hardware description languages. The goal is the successful and self-developed completion of the project and the exchange of the knowledge gained in teamwork.

| Contents                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                              |                   |                                                          |
| <p>In this course, students will learn about the leading contenders for post-silicon storage-class and main memory technologies. Decades of research have yielded several efficient memory device working principles, including phase-change of the structure (PCM), materials conversion (OxRAM), ion diffusion (CBRAM), magnetic properties (STT-MRAM, MTJ), and ferroelectricity (FRAM, FeFET). Currently, these memory technologies are transitioning from research to industry, and are predicted to have at least niche applications in the ever-growing hardware market. Some technologies, such as PCM, may even eventually surpass silicon-based flash memory, providing better performance and unique features.</p> <p>Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.</p> |                              |                   |                                                          |
| Objective qualification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |                   |                                                          |
| <p>After successfully completing the module, students will understand the biological principles of neural information processing and their differences to the von Neumann architecture. They know the basic methods for hardware implementation of neuromorphic systems. They will also be able to design simple neuromorphic algorithms for specific applications and analyze their performance. Finally, they will be able to evaluate the strengths, weaknesses and current developments of neuromorphic systems and assess their potential for various application areas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                              |                   |                                                          |

## Related courses

### Rules for the choice of courses

Courses totalling 8-10 credits (Master Electrical Engineering) and 5-10 credits (Master Industrial Engineering Specialized in Electrical Engineering) have to be selected from the available laboratories/practical courses.

Labs can have 1 to 5 credits and are offered as "Labor" (L), "Übung" (Ü) or "Praktikum" (P). The individual description of the course applies in each case. Additional notes and comments in the individual course descriptions have to be taken into account.

### Compulsory attendance

| <p>The industrial internship provides in-depth preparation for professional life by working directly in an industrial company for at least 10 weeks. Students gain insight into organisational and operational processes and structures as well as into the work methods of engineering activities in industrial companies. Within the wide variety and breadth of structural areas (e.g. research, development, production, sales,...) and fields of activity (e.g. hardware or software development, production planning, quality assurance, sales, (project) management,...) in an industrial company, an exemplary selection with in-depth familiarisation with one or a few of these areas or fields is expected.</p> <p>The aim of the module is the further development of action patterns and techniques appropriate to the situation and task as well as the further development and adaptation of the methodological skills taught during the course in the engineering solution of technical problems. In addition, students deepen their interdisciplinary knowledge and skills (e.g. discussion and negotiation skills, presentation techniques, documentation, etc.), for example by participating in meetings or by being involved in conceptual, planning or management tasks. They also carry out their own engineering activities (e.g. in conceptual planning, development or quality assurance) independently and represent their own interests. In doing so, they apply the technical knowledge and skills acquired during their studies to practical tasks in an industrial environment.</p> <p>The activities carried out as part of the industrial internship must be presented in an ungraded presentation. The presentation, including preparation and follow-up work, is worth 3 credits within the 12 credits of this module.</p> |                                                                                                                                                                                                                       |                   |                                                          |

| Remark                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                       |                   |                                                          |

The activities carried out as part of the industrial internship must be presented in an ungraded presentation. The presentation, including preparation and follow-up work, is worth 3 credits within the 12 credits of this module. The workload is exclusively at the location of the industrial partner, usually outside the university.

| Course achievement                                                                                                                                                                                                                               | The Master's team project corresponds to the examination requirements of the draft (§ 9 APO). A written project plan must be submitted for the Master's team project at the beginning, which is to be updated during the course of the project. The comparison between initial planning and actual progress must be presented and justified in the final report. The results of the Master's team project must be summarized in a report in which the individual contributions of the project participants are identified. Furthermore, the results must be presented in a presentation (§ 9 APO). |                   |                                                          |

| <p>With the successful completion of the final thesis (§ 14 APO) and the presentation, the student demonstrates that he/she is able to work independently on a problem from the chosen subject area using scientific methods within a specified period of time. The qualification objectives of the degree program (Annex 1, § 2 APO) are reflected in the implementation and results of the final thesis with regard to the following components:</p> <ul style="list-style-type: none"><li>• Independent familiarisation with and scientific methodical processing of a topic fundamentally relevant to further development and research in the field of electrical engineering</li><li>• Literature research and presentation of the state of the art</li><li>• Development of new solution approaches for a scientific problem</li><li>• Presentation of the approach and results in the form of a paper</li><li>• Presentation of the main results in a comprehensible form</li><li>• Consolidation and refinement of key qualifications: management of an own project, presentation techniques and rhetorical skills</li></ul> |                                                                                                                                                                                                                                                                                            |                   |                                                          |
| Literature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                            |                   |                                                          |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                            |                   |                                                          |
| Remark                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                            |                   |                                                          |
| The Master's thesis is credited with 28 credits and the presentation with 2 credits; the assessment of the presentation is included in the overall grade of the final module with double weighting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                            |                   |                                                          |
