

1	Introduction.....	1
1.1	Motivation.....	1
1.2	Objectives of this work .....	2
1.3	Structure of this work .....	2
2	The global equivalence ratio concept.....	4
2.1	Equivalence ratios.....	4
2.2	General approach .....	5
2.3	Measurement techniques to determine the GER .....	6
2.3.1	Measurement by two thermocouple trees.....	7
2.3.2	Measurement by one corner thermocouple tree.....	7
2.3.3	Measurement by a phi-meter at a representative location.....	8
2.3.4	Measurement by centreline thermocouples and bi-directional pressure probes .....	8
2.3.5	Measurement by an array of thermocouples and bi-directional pressure probes .....	9
2.3.6	Expected mass flow .....	9
2.4	Extensive review of research under application of the GER-concept.....	11
2.4.1	Beyler's hood experiments .....	11
2.4.2	Hood experiments at the California Institute of Technology .....	13
2.4.3	Engineering methodology of Gottuk and Lattimer .....	17
2.4.4	Pitts' algorithm for estimating CO formation .....	22
2.4.5	Experiments in the ISO 9705 room within the TOXFIRE project .....	25
2.4.5.1	Original work .....	25
2.4.5.2	Some remarks on the experiments in the ISO 9705 room within the TOXFIRE project .....	27

Contents

2.4.6	The iBMB research.....	30
2.4.6.1	Original work .....	30
2.4.6.2	Some remarks on the experiments in the ISO 9705 room within the iBMB project .....	33
2.4.7	Wieczorek’s methodology.....	36
2.4.7.1	Original work .....	36
2.4.7.2	Some remarks on Wieczorek’s study .....	39
2.4.8	Conclusions and open questions.....	40
2.4.8.1	Determination of the global equivalence ratio .....	40
2.4.8.2	The correlation of the CO yields with the GER.....	41
2.4.8.3	Treatment of external combustion.....	45
3	Compartment fire dynamics and plume theory.....	47
3.1	Scope of application of the GER-concept .....	47
3.2	Compartment fires without external combustion .....	49
3.2.1	Mass exchanges in compartment fires .....	49
3.2.2	Properties of the fire plume .....	54
3.2.2.1	General characteristics of fire plumes .....	54
3.2.2.2	Scaling parameters and flame height correlations .....	55
3.2.2.3	Mass entrainment and combustion in the fire plume .....	57
3.2.2.4	Behaviour of a flame immersed in the upper layer.....	60
3.2.3	Vitiation studies .....	62
3.2.3.1	Phenomenon.....	62
3.2.3.2	Review of vitiation studies .....	62
3.2.3.3	Examination of the influence of vitiation .....	64

3.2.4	Pyrolysis in the upper layer .....	65
3.3	Compartment fires with external combustion .....	67
3.3.1	Criteria to assess external combustion.....	68
3.3.1.1	The excess fuel factor and its correlation with the GER.....	69
3.3.1.2	The critical mass loss rate and its correlation with the GER.....	69
3.3.1.3	The ignition index and its correlation with the GER.....	73
3.3.1.4	Extensions of Beyler's external combustion equivalence ratio .....	75
3.3.1.5	Conclusions about the criteria to assess external combustion .....	80
3.3.2	Efficiency of external combustion to reduce CO yields.....	81
3.3.2.1	CO reduction in ambient atmospheres.....	81
3.3.2.2	CO reduction in adjacent hallways .....	82
4	Applicability of numerical fire simulation.....	85
4.1	Main features of the Fire Dynamics Simulator.....	85
4.2	Validation studies .....	88
4.2.1	Literature review.....	88
4.2.2	Own studies.....	89
4.2.2.1	Fully developed fires in the half-scale and full-scale ISO 9705 compartment.....	89
4.2.2.2	Flame heights and flame extensions .....	93
4.3	Relationships between mixture fraction, equivalence ratio and ignition index .....	95
4.3.1	Illustration by the ternary diagram .....	96
4.3.2	Suitability of the FDS4 suppression algorithm for assessing external combustion .....	98
4.3.3	Combining FDS4 output data with Beyler's ignition criterion .....	99

Contents

4.4 Conclusions..... 102

5 Other toxic fire gas components..... 104

5.1 Toxic key species and toxicity models ..... 104

5.2 Applicability of the GER-concept to the key species ..... 107

5.2.1 Nitrogenated fire effluents ..... 107

5.2.2 Halogenated fire effluents..... 109

5.2.3 Sulphur-containing fire effluents ..... 110

5.2.4 Organic fire effluents ..... 111

5.3 Application of the FED model for well-ventilated and under-ventilated situations..... 113

6 Conclusions and open questions..... 116

6.1 Methodology to determine species yields of compartment fires..... 116

6.2 Open questions ..... 118

7 Summary..... 119

Abbreviations ..... 121

Nomenclature ..... 123
