Abstract i

Zusammenfassung iii

Vorwort v

Nomenclature xiii

1. Introduction 1
- 1.1. Motivation . . . 2
- 1.2. Outline of this thesis . . . 3

2. Incorporation of risk in FPE 5
- 2.1. Definition of risk . . . 5
  - 2.1.1. Objective and subjective risk . . . 6
  - 2.1.2. Individual and collective risk . . . 7
  - 2.1.3. Voluntary and involuntary risk . . . 8
  - 2.1.4. Risk treatment . . . 9
- 2.2. Consequences and acceptable risk . . . 10
  - 2.2.1. Qualitative assessment (risk matrix) . . . 11
  - 2.2.2. Mortality rates . . . 11
  - 2.2.3. As low as reasonably practicable (ALARP) . . . 11
  - 2.2.4. Lost life years . . . 12
  - 2.2.5. Life quality index . . . 13
- 2.3. Probabilities . . . 14
  - 2.3.1. Referencing probabilities . . . 14
  - 2.3.2. Operational probability . . . 15
- 2.4. Probabilistic design . . . 16
  - 2.4.1. Comparative probabilistic design . . . 16
  - 2.4.2. Absolute probabilistic design . . . 16

2.5. Review of risk-informed approaches in FPE 17
2.6. Conclusions for a risk informed life-safety approach 19

3. Hierarchy for life safety design **21**
3.1. Prescriptive design–codes and standards 21
3.2. Performance-based approach 24
3.2.1. Empirical safety concept 25
3.3. Proposed verification levels and hierarchy 25
3.3.1. Level Ia: Prescriptive design 26
3.3.2. Level Ib: Compensation 26
3.3.3. Level IIa: Maintaining visibility and tenability 27
3.3.4. Level IIb: Simplified timed egress 28
3.3.5. Level III: Advanced timed egress 28
3.3.6. Hierarchical classification and required competencies 29
3.4. Conclusions 30

4. FPE models for life safety analysis **31**
4.1. Fire modeling 31
4.1.1. Mass loss model 32
4.1.2. Zone models 33
4.1.3. CFD (field) models 34
4.2. Criteria and thresholds to determine ASET 37
4.2.1. Implicit hazard criteria 37
4.2.2. Asphyxiant gases 40
4.2.3. Irritant gases 43
4.2.4. Heat 44
4.2.5. Threshold models 46
4.2.6. Considering multiple criteria 48
4.3. Evacuation modeling 49
4.3.1. Crowd movement simulation 51
4.4. Design scenarios 54
4.4.1. Design fires 55
4.4.2. Egress design 60
4.5. Conclusions 61

5. Reliability analysis **63**
5.1. Univariate random models 63
5.2. Multivariate random models 66
5.2.1. Joint probability functions 66
5.2.2. Random vectors 67
5.2.3. The Nataf-model 69
5.2.4. Convolution of random variables 69

5.3. Data mining . . . 70
5.3.1. Estimating statistical moments . . . 70
5.3.2. Empirical distribution . . . 71
5.3.3. Pitfalls . . . 71
5.4. Sampling strategies . . . 72
5.4.1. Univariate sampling using the inverse transform method . . . 72
5.4.2. Multivariate sampling . . . 73
5.4.3. Latin hypercube sampling . . . 73
5.4.4. Quasi-random sampling . . . 75
5.4.5. Systematic Sampling (Design of Experiments) . . . 75
5.5. The reliability problem . . . 77
5.5.1. The generalized reliability problem . . . 79
5.5.2. Approximative methods . . . 79
5.5.3. Integration methods . . . 81
5.5.4. Limitations of the described reliability methods . . . 83
5.5.5. System analysis . . . 84
5.6. Conclusions . . . 88

6. An IMLS response surface method **89**
6.1. Preceding sensitivity analysis . . . 92
6.1.1. Significance of correlation . . . 92
6.1.2. Global contribution to prediction accuracy (stepwise regression) . 94
6.2. Surrogate modeling . . . 95
6.2.1. General linear least-squares . . . 96
6.2.2. Weighted least-squares . . . 98
6.2.3. Moving least-squares . . . 99
6.2.4. Weighting functions . . . 100
6.3. Reliability analysis . . . 101
6.3.1. Basic methodology of AIS . . . 103
6.3.2. Empirical sensitivity factors . . . 105
6.4. Surrogate adaptivity and convergence criteria . . . 106
6.4.1. Decomposition of the covariance . . . 106
6.4.2. Importance-based DoE . . . 107
6.5. Parallelization . . . 109
6.6. Adaptive discretization . . . 110
6.7. Validation and benchmarking . . . 112
6.7.1. Analytical function . . . 112
6.7.2. Zone fire model . . . 115
6.8. Conclusions . . . 118

7. Quantification of safety levels 119
7.1. Multi-purpose community assembly building . . . 120
7.2. Fire scenarios on the basis of NFPA 101 . . . 121
7.3. Stochastic models . . . 123
7.3.1. Models for fire simulation . . . 124
7.3.2. Models for evacuation simulation . . . 126
7.4. Reliability assessment . . . 129
7.4.1. System analysis . . . 130
7.4.2. Scenario 1: Standard scenario . . . 130
7.4.3. Scenario 2: Hidden smoldering fire . . . 135
7.4.4. Scenario 3: Blocking primary exit . . . 136
7.4.5. Scenario 4: Ultra-fast fire . . . 138
7.4.6. Overall reliability . . . 138
7.5. Modeling and impact of fire protection barriers . . . 139
7.5.1. Automatic detection system . . . 140
7.5.2. Smoke and heat exhaustion . . . 142
7.5.3. Supression systems . . . 144
7.5.4. Organizational fire protection and trained personnel . . . 148
7.6. Full system analysis and barrier interaction effects . . . 150
7.7. Conclusions . . . 154

8. Summary and Conclusions 155
8.1. Conclusions for a risk-informed life safety code . . . 156
8.1.1. Code elements . . . 157
8.1.2. Proposed safety format . . . 159
8.2. Further research possibilities . . . 160

Bibliography 163

A. Matrices of the example in Section 6.2 179
A.1. Least squares . . . 179
A.2. Interpolating moving least squares . . . 180

B. Weighting functions 183
B.1. Gaussian weighting . . . 183
B.2. Spline weighting . . . 185

C. Distribution functions **187**
C.1. Normal distribution 187
C.2. Log-normal distribution 188
C.3. Gumbel distribution 188
C.4. Exponential distribution 189
C.5. Multivariate normal distribution 189

D. MATLAB Toolbox for automated analysis **191**
D.1. File and I/O handling 191
D.2. Sensitivity analysis 192
D.3. Surrogate construction 192
D.4. Reliability analysis 192
D.5. Interaction 193
